#### Abstract

The title dinuclear $\mathrm{Cu}^{\text {II }}$ complex, $\left[\mathrm{Cu}_{2}\left(\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{NO}_{2}\right)_{2}\left(\mathrm{C}_{7} \mathrm{H}_{9}-\right.\right.$ $\left.\left.\mathrm{NO}_{2}\right)_{2}\right]\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2}$, has been synthesized by the reaction of $\mathrm{Cu}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ with $\mathrm{pdmH}_{2}\left(\mathrm{pdmH}_{2}\right.$ is pyridine-2,6diyldimethanol) in the presence of tetrabutylammonium hydroxide. The title complex contains a centrosymmetric $\mathrm{Cu}_{2} \mathrm{O}_{2}$ core and each $\mathrm{Cu}^{\mathrm{II}}$ atom has distorted octahedral geometry. Molecular $\left[\mathrm{Cu}_{2}(\mathrm{pdmH})_{2}\left(\mathrm{pdmH}_{2}\right)\right]^{2+}$ cations are connected by hydrogen bonds involving the $\mathrm{CH}_{3} \mathrm{COO}^{-}$ anions, forming one-dimensional chains along the $a$ axis.

## Comment

The pyridine-2,6-diyldimethanolate ligand functions as a bridge through its two O atoms to afford polynuclear metal complexes (Boskovic et al., 2002; Yoo et al., 2000). Our main strategy is to synthesize polynuclear copper complexes using $\mathrm{N}, \mathrm{O}$-donor hydroxyalkylpyridyl ligands, because these cluster complexes act as model complexes for the active centers of many metalloenzymes (Agnus, 1983) and as supramolecular building blocks for promising magnetic materials (Del Sesto et al., 2000). Little attention has been paid to copper complexes

(I)
based on N,O-donor hydroxyalkylpyridyl ligands, although a few mononuclear (Andac et al., 2002; Koman et al., 2000) and dinunclear complexes (Cheng \& Wei, 2002) have been reported. We report here the synthesis and X-ray structure of

Figure 1
An ORTEP-3 (Farrugia, 1997) diagram of (I), with the atomic numbering scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level.
a new dinuclear $\mathrm{Cu}^{\mathrm{II}}$ complex, viz. the title complex, (I), which has been obtained from the reaction of $\mathrm{Cu}(\text { acetate })_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ and $\mathrm{pdmH}_{2}\left(\mathrm{pdmH}_{2}\right.$ is pyridine-2,6-diyldimethanol) in the presence of tetrabutylammonium hydroxide.

The complex cation of (I) comprises a $\mathrm{Cu}_{2}^{\mathrm{II}}(\mu-\mathrm{O})_{2}$ core, in which the two $\mu-\mathrm{O}$ atoms belong to the bridging $\mathrm{pdmH}^{-}$ ligand. As shown in Fig. 1, each $\mathrm{Cu}^{\mathrm{II}}$ atom is coordinated by neutral $\mathrm{pdmH}_{2}$ as a terminal tridentate ligand and anionic $\mathrm{pdmH}^{-}$as a bridging bidentate ligand. The crystallographic inversion center is located in the middle of the $\mathrm{Cu}_{2} \mathrm{O}_{2}$ rhombus. In the planar $\mathrm{Cu}_{2} \mathrm{O}_{2}$ unit, the $\mathrm{Cu} \cdots \mathrm{Cu}$ separation and $\mathrm{Cu}-\mathrm{O}-\mathrm{Cu}$ angle are comparable to those of other alkoxo-bridged $\mathrm{Cu}_{2} \mathrm{O}_{2}$ complexes (Berti et al., 2003; Cheng \& Wei, 2002; Graham et al., 2001). Each Cu atom has a highly distorted octahedral geometry (see Table 1), with acute $\mu$-O-$\mathrm{Cu}-\mu-\mathrm{O}$ and $\mathrm{N}-\mathrm{Cu}-\mathrm{O}$ angles that are similar to those found in other distorted-octahedral $\mathrm{CuO}_{4} \mathrm{~N}_{2}$ cores containing the $\mathrm{pdmH}_{2}$ ligand (Andac et al., 2002; Koman et al., 2000). The axial $\mathrm{Cu} 1-\mathrm{O} 1$ [2.358 (2) Å] and $\mathrm{Cu} 1-\mathrm{O} 2$ [2.360 (2) $\AA$ ] distances are substantially longer than the equatorial $\mathrm{Cu}-\mathrm{O}$ and $\mathrm{Cu}-\mathrm{N}$ distances $[1.909$ (2)-2.094 (2) $\AA$ ], which indicates severe Jahn-Teller distortion, despite the restraining effects of the chelate rings. The equatorial distances are similar to the corresponding distances in the tetragonally elongated octahedral $\left[\mathrm{Cu}\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{NO}\right)_{6}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ complex (Wood et al., 1984), while the axial $\mathrm{Cu}-\mathrm{O}$ bond distances are shorter than the bond length of $2.478(2) \AA$ found in $\left[\mathrm{Cu}\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{NO}\right)_{6}\right]-$ $\left(\mathrm{NO}_{3}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ and that of $2.548 \AA$ found in $[\mathrm{Cu}(3,2,3-$ tet $)-$ $\left.\left(\mathrm{ClO}_{4}\right)\right]_{n} \quad\left[3,2,3\right.$-tet is $\quad N, N^{\prime}$-bis(3-aminopropyl)ethylenediamine; Kwak et al., 2001], in which axial coordination ligands have no geometric constraints. The $\mathrm{O} 1-\mathrm{Cu} 1-\mathrm{O} 2$ angle [147.54 (8) ${ }^{\circ}$ ] is significantly smaller than $180^{\circ}$.
It is difficult to estimate quantitatively the elongation of the axial $\mathrm{Cu}-\mathrm{O}$ bond that results from the Jahn-Teller effect and from the geometric restraints of the chelate ring. However, it
is certain that there is conflict between stabilization from the Jahn-Teller effect and the geometric requirements, because the nature of the chelate ring tends to restrict the distortion of a complex (Huheey, 1983). The bond parameters of (I) do not differ from those of various $\mathrm{Cu} L_{2}$ compounds having the $\mathrm{CuO}_{4} \mathrm{~N}_{2}$ chromophore ( $L=$ chelate ligand; Koman et al., 2000) and $\mathrm{Cu}^{\mathrm{II}}$ compounds containing the pdmH fragment (Atkinson et al., 2000), whereas $\left[\mathrm{Cu}\left(\mathrm{pdmH}_{2}\right)_{2}\right]^{2+}$ exhibits a Jahn-Teller contraction effect (Andac et al., 2002).

Figure 2
The crystal packing of (I), viewed approximately down the $c$ axis, showing the linear chain structure formed via hydrogen bonds (dashed lines). Ellipsoids are drawn at the $30 \%$ probability level. [Symmetry codes: (i) $x, 1+y, z$; (ii) $-x, 1-y,-z$; (iii) $1-x, 1-y,-z$.]

Adjacent dinuclear copper complex units are associated via hydrogen bonds between the hydroxide groups of the $\mathrm{pdmH}_{2}$ ligands and the acetate anions, as illustrated in Fig. 2 and Table 2. There is one carboxylate anion in the asymmetric unit. Carboxylate atom O 5 interacts with two hydroxide H atoms of adjacent $\mathrm{pdmH}_{2}$ ligands, while carboxylate atom O6 interacts with the H atom on hydroxide atom O 4 of a $\mathrm{pdmH}^{-}$group, resulting in one-dimensional linear chains running parallel to the $a$ axis.

## Experimental

To a green solution of $\mathrm{Cu}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}(0.3254 \mathrm{~g}, 1.63 \mathrm{mmol})$ in acetonitrile ( 30 ml ) was added $\mathrm{pdmH}_{2}(0.56 \mathrm{~g}, 4 \mathrm{mmol})$. The reaction mixture was stirred continuously, and then a solution of $n-\mathrm{Bu}_{4} \mathrm{NOH}$ $(0.4 \mathrm{ml}, 1.0 \mathrm{M})$ in methanol was added dropwise, causing the color of the reaction mixture to change to bright blue. The solution was stirred for 4 h , then filtered and concentrated under reduced pressure. The resulting green solution was treated with hexane to afford a crystalline solid. Recrystallization from a dichloromethane-hexane solution gave single crystals suitable for X-ray analysis. Analysis found: C 48.7, H 5.09, N 7.14\%; $\mathrm{C}_{32} \mathrm{H}_{40} \mathrm{Cu}_{2} \mathrm{~N}_{4} \mathrm{O}_{12}$ requires: C 48.1, H $5.04, \mathrm{~N} 7.00 \%$.
