The title compounds, 4-(2-naphthyloxymethylcarbonyl)morpholine, $C_{16}H_{17}NO_3$, (I), and 4-methyl-1-(2-naphthyloxymethylcarbonyl)piperazine, $C_{17}H_{20}N_2O_2$, (II), are potential anti-amnesics. The morpholine ring in (I) and the piperazine ring in (II) adopt chair conformations. In (I), the molecules are linked by weak intermolecular C—H...O interactions into chains that have a graph-set motif of $C(10)$, while in (II), the molecules are linked by weak intermolecular C—H...O interactions that generate two $C(7)$ graph-set motifs. The dihedral angle between the naphthalene moiety and the best plane through the morpholine ring is $20.62(4)^\circ$ in (I), while the naphthalene moiety is oriented nearly perpendicular to the mean plane of the piperazine ring in (II).

Comment

The conformation of molecules with anti-amnesic activity has attracted considerable interest (Amato *et al.*, 1991), and the present structure determinations are part of our research program on biologically active 2-(2-naphthyloxy)acetate derivatives. We report here the preparation and the X-ray crystal structures of 4-(2-naphthyloxymethylcarbonyl)morpholine, (I), and 1-(2-naphthyloxymethylcarbonyl)-4-methylpiperazine, (II), both of which are new classes of anti-amnesic agents (Thamocharan *et al.*, 2003, and references therein).

Views of the molecules of (I) and (II), with the atomic numbering schemes, are shown in Figs. 1 and 2, respectively.

[†] Deceased.

The corresponding bond lengths and angles in (I) and (II) are essentially equivalent and are comparable to those in the related structures 1-(2-naphthyloxymethylcarbonyl)piperidine and 3-methyl-1-(2-naphthyloxymethylcarbonyl)piperidine (Thamocharan *et al.*, 2003). In the molecule of (I), the central $C2/O11/C12/C13/N14$ fragment is planar, with a maximum deviation of $0.023(1) \text{ \AA}$ for atom C13. In contrast, only the $O11/C12/C13/N14$ segment is planar in (II), while atom C2 is twisted about the $O11-C12$ bond so that it lies almost perpendicular to the $O11/C12/C13/N14$ plane (Table 3). In (I), the central unit is almost coplanar with the naphthalene moiety, the angle between the planes being $3.67(7)^\circ$, while the dihedral angle between the central unit and the naphthalene moiety in (II) is $76.94(15)^\circ$. The central unit is twisted $27.79(14)^\circ$ out of the mean plane of the piperazine ring in (II), whereas it is twisted $21.73(6)^\circ$ out of the best plane passing through the morpholine ring in (I). The $C2-O11-C12-C13$ and $O11-C12-C13-N14$ torsion angles show that the central unit has an antiperiplanar conformation in (I), while the corresponding torsion angles in (II) represent synclinal and antiperiplanar conformations, respectively.

The morpholine ring in (I) has a chair conformation [the Cremer & Pople (1975) puckering parameters are $Q = 0.550(1) \text{ \AA}$, $q_2 = 0.045(1) \text{ \AA}$, $q_3 = 0.548(1) \text{ \AA}$, $\theta = 4.7(1)^\circ$ and $\varphi_2 = 345.8(19)^\circ$ for the atom sequence $O17-C16-C15-N14-C19-C18$]. The dihedral angle between the naphthalene moiety and the morpholine ring is $20.62(4)^\circ$. In (II), the puckering parameters of the piperazine ring [$Q = 0.5585(3) \text{ \AA}$, $q_2 = 0.016(3) \text{ \AA}$, $q_3 = 0.558(3) \text{ \AA}$, $\theta = 0.7(3)^\circ$ and $\varphi_2 = 131(10)^\circ$ for the atom sequence $N14-C15-C16-N17-C18-C19$] are indicative of a chair conformation, and the methyl substituent at atom N17 is in an equatorial position. The sum of the angles around N17 is 331° , revealing an essentially pyramidal geometry at atom N17. In contrast,

Figure 1

A view of the molecule of (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level and H atoms are represented by circles of arbitrary radii.

Figure 2

A view of the molecule of (II), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level and H atoms are represented by circles of arbitrary radii.

atom N14 in (I) and (II) does not exhibit a pyramidal geometry because of the amide-type conjugation with carbonyl atom O13. The sum of the angles around atom N14 in (I) and (II) is 360° (Tables 1 and 3). The naphthalene moiety is oriented nearly perpendicular to the mean plane of the piperazine ring.

The exocyclic C1–C2–O11 and C13–N14–C15 angles deviate significantly from the usual value of 120° (Tables 1 and 3), perhaps as a result of steric repulsion [$\text{H1}\cdots\text{H121} = 2.21 \text{ \AA}$ (2.10 \AA), $\text{H121}\cdots\text{H151} = 2.25 \text{ \AA}$ ($\text{H121}\cdots\text{H152} = 2.26 \text{ \AA}$) and $\text{H122}\cdots\text{H151} = 2.17 \text{ \AA}$ ($\text{H122}\cdots\text{H152} = 2.11 \text{ \AA}$); the values in parentheses correspond to (II)].

As can be seen from Table 2, in (I), atom C1 acts as a donor in a weak intermolecular C–H \cdots O interaction with atom O17 of an adjacent molecule. This interaction links the molecules into chains that run parallel to the *c* axis and have a graph-set motif of *C*(10) (Bernstein *et al.*, 1995).

In (II), atom C1 acts as a donor for a weak intermolecular C–H \cdots O interaction with carbonyl atom O13 of an adjacent molecule (Table 4). This interaction produces a continuous chain that runs parallel to the *c* axis and has a graph-set motif of *C*(7). In addition, atom C5 is involved in an intermolecular C–H \cdots O interaction with atom O11 of a different molecule. This interaction links the molecules into a continuous chain that runs parallel to the *a* axis and has a graph-set motif of *C*(7) (Bernstein *et al.*, 1995).

Experimental

For the preparation of (I), methyl 2-(2-naphthoxy)acetate (0.5 g) was reacted with morpholine. The oily product obtained was treated with water, and the resulting precipitate was filtered off, dried and crystallized from acetone to afford crystals of (I) (yield 0.532 g,

84.8%; m.p. 416–418 K). For the preparation of (II), methyl 2-(2-naphthoxy)acetate (0.5 g) was reacted with *N*-methylpiperazine. The oily product obtained was treated with water, and the resulting precipitate was filtered off, dried and crystallized from ethanol to afford crystals of (II) (yield 0.514 g, 78.17%; m.p. 383–385 K).

Table 4

Hydrogen-bonding geometry (\AA , $^\circ$) for (II).

$D-H \cdots A$	$D-H$	$H \cdots A$	$D \cdots A$	$D-H \cdots A$
C1–H1 \cdots O13 ⁱⁱⁱ	0.95	2.55	3.471 (3)	163
C5–H5 \cdots O11 ⁱⁱⁱ	0.95	2.49	3.236 (3)	135

Symmetry codes: (ii) $\frac{1}{2} - x, y, z - \frac{1}{2}$; (iii) $\frac{1}{2} + x, 1 - y, z$.

For compound (I), all H atoms were placed in idealized positions ($C-H = 0.95-0.99 \text{ \AA}$) and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H})$ values of $1.2U_{\text{eq}}(\text{C})$. For compound (II), methyl H atoms were constrained to an ideal geometry ($C-H = 0.98 \text{ \AA}$), with $U_{\text{iso}}(\text{H})$ values of $1.5U_{\text{eq}}(\text{C})$, but were allowed to rotate freely about the C–C bond. All remaining H atoms were placed in idealized positions ($C-H = 0.95-0.99 \text{ \AA}$) and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H})$ values of $1.2U_{\text{eq}}(\text{C})$. Although the molecule is achiral, the structure possesses a polar axis. Because of the absence of any

significant anomalous scatterers in the compound, attempts to confirm the absolute structure by refinement of the Flack (1983) parameter in the presence of 1099 sets of Friedel equivalents led to an inconclusive value (Flack & Bernardinelli, 2000) of -0.1 (15) for this parameter. Therefore, the absolute direction of the polar axis was assigned arbitrarily and the Friedel pairs were merged before the final refinement. Reflection 110 was partially obscured by the beam stop and was omitted.

For both compounds, data collection: *COLLECT* (Nonius, 2000); cell refinement: *DENZO-SMN* (Otwinowski & Minor, 1997); data reduction: *DENZO-SMN* and *SCALEPACK* (Otwinowski & Minor, 1997); program(s) used to solve structure: *SIR92* (Altomare *et al.*, 1994); program(s) used to refine structure: *SHELXL97* (Sheldrick, 1997); molecular graphics: *ORTEP-3 for Windows* (Farrugia, 1997); software used to prepare material for publication: *PARST97* (Nardelli, 1995) and *PLATON* (Spek, 2003).

ST thanks the X-ray Crystallography Facility, Institute of Organic Chemistry, University of Zurich, Switzerland, for providing access to the facility during his visit in August 2002.

Supplementary data for this paper are available from the IUCr electronic archives (Reference: SK1649). Services for accessing these data are described at the back of the journal.
