# trans-Bis(3,5-diaza-1-azonia-7-phosphaadamantane- $\kappa$ P)bis(thio-cyanato- $\kappa$ S) palladium(II) bis(thiocyanate) 

Anna M. M. Meij, ${ }^{\text {a }}$ Stefanus Otto ${ }^{\text {b }}$ and Andreas Roodt ${ }^{\text {c }}$ *<br>${ }^{\text {a }}$ Department of Chemistry, University of the Free State, PO Box 339, Bloemfontein 9300, South Africa, ${ }^{\text {b }}$ Sasol Technology R\&D, PO Box 1, Sasolburg 1947, South<br>Africa, and ${ }^{c}$ Department of Chemistry and Biochemistry, Rand Afrikaans University, PO Box 524, Johannesburg 2006, South Africa<br>Correspondence e-mail: aroo@rau.ac.za<br>Received 6 May 2003<br>Accepted 9 July 2003<br>Online 9 August 2003

The crystal structure of the title compound, trans$\left[\mathrm{Pd}(\mathrm{NCS})_{2}\left(\mathrm{C}_{6} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{P}\right)_{2}\right](\mathrm{NCS})_{2}$, is one of the few palladium(II) complexes containing two protonated watersoluble 1,3,5-triaza-7-phosphaadamantane (PTA) ligands reported to date. The compound displays a distorted squareplanar geometry, with the Pd atom on an inversion centre and with the $S$ atoms of the thiocyanate counter-ions occupying the axial positions above and below the equatorial plane described by the phosphine and thiocyanate ligands. Geometric parameters for the formal coordination polyhedron include a $\mathrm{Pd}-\mathrm{P}$ distance of 2.2940 (8) $\AA$, a $\mathrm{Pd}-\mathrm{S}$ distance of 2.3509 (8) $\AA$ and a $\mathrm{P}-\mathrm{Pd}-\mathrm{S}$ angle of 89.45 (3) ${ }^{\circ}$. The effective cone angle for the PTA ligands was calculated as $114.5^{\circ}$.

## Comment

In the past few years, numerous 1,3,5-triaza-7-phosphaadamantane (PTA) complexes exhibiting catalytic activity have been reported (Alyea et al., 1993; Joó et al., 1996; Darensbourg et al., 1997, 1999). PTA is a neutral air-stable aliphatic phosphine with a small steric demand (Daigle et al., 1998; Otto \& Roodt, 2001a). The potentially tetradentate PTA ligand coordinates to the metal centre only through the P atom, as observed in all of the metal-PTA complexes characterized to date (Cambridge Structural Database; Allen, 2002).

In this paper, we report the structure of the title compound, (I), as part of our systematic investigation of the basic coordination mode and solution properties of these complexes. The title compound is the first example of a square-planar complex that has a trans geometry and that contains protonated PTA ligands. Both PTA ligands are protonated at one of the N atoms, resulting in a dicationic complex, and therefore two thiocyanate counter-ions cocrystallize with the coordina-
tion compound to ensure neutrality. The compound crystallizes as discrete distorted square-planar moieties, and the $S$ atoms of the thiocyanate counter-ions in the apical positions above and below the equatorial plane are involved in weak interactions (see Fig. 1). This conformation results in infinite chains of alternating cations and $\mathrm{NCS}^{-}$counter-ions, and (I) is the first example of a compound in which such an interaction involves a $\mathrm{Pd}^{2+}$ metal centre and an $\mathrm{NCS}^{-}$ion (Allen, 2002).

(I)

The Pd atom is situated on an inversion center in the monoclinic space group $P 2_{1} / n$, thus imposing planarity of the equatorial ligands with symmetry-equivalent ligands in a relative trans orientation. The angles in the coordination polyhedron are close to the ideal value of $90^{\circ}$, the $\mathrm{P}-\mathrm{Pd}-\mathrm{S} 10$ angle being 89.45 (3) $)^{\circ}$ (Table 1). The $\mathrm{Pd}-\mathrm{S} 10$ and $\mathrm{Pd}-\mathrm{P}$ bond lengths in the coordination polyhedron are 2.3509 (8) and 2.2940 (8) $\AA$, respectively. Both of the $\mathrm{NCS}^{-}$ligands, as well as the $\mathrm{NCS}^{-}$counter-ions, interact with the Pd metal centre via the $S$ atoms in a manner indicative of a soft metal centre. The $\mathrm{Pd} \cdot \cdots \mathrm{S} 11$ interaction at the apical positions of the square plane, occupied by the $\mathrm{NCS}^{-}$counter-ions, is 3.4383 (9) $\AA$ and is thus significantly longer than the formal $\mathrm{Pd}-\mathrm{S} 10$ bond. The $\mathrm{Pd}-\mathrm{S} 10-\mathrm{C} 10$ angle $\left[102.71(10)^{\circ}\right.$ ] is characteristic of a thiocyanate ligand coordinated via the S atom. Similarly, although the interaction is weak, the $\mathrm{Pd}-\mathrm{SCN}$ moiety in the apical position exhibits a bent orientation, with a $\mathrm{Pd}-\mathrm{S} 11-\mathrm{C} 11$ angle of $95.56(9)^{\circ}$.
The $\mathrm{C} 10-\mathrm{N} 10$ and $\mathrm{C} 11-\mathrm{N} 11$ bond lengths [1.155 (3) and 1.158 (3) $\AA$, respectively] are the same within experimental

Figure 1
The structure and atom-numbering scheme of a molecule of (I), with displacement ellipsoids shown at the $30 \%$ probability level. Only the H atoms on the protonated N atoms of the PTA ligands are included, and these H atoms are represented by spheres of arbitrary size. [Symmetry code: (i) $-x,-y, 1-z$.]
error. However, the $\mathrm{S} 10-\mathrm{C} 10$ bond is 1.677 (3) $\AA$, whereas the $\mathrm{S} 11-\mathrm{C} 11$ bond in the $\mathrm{NCS}^{-}$counter-ion is significantly shorter $[1.628$ (3) $\AA$ ]. These last two bond lengths are indicative of the resonance structure of the thiocyanate group, implying more of a double-bond character for the S11-C11 moiety. Since $\mathrm{Pd}-\mathrm{S} 10$ is a formal bond, the S atom donates electron density to the metal centre, thus resulting in the $\mathrm{S} 10-$ C10 bond having more of a single-bond character and hence being a weaker bond. The $\mathrm{S} 10-\mathrm{C} 10-\mathrm{N} 10$ angle is 176.8 (3) ${ }^{\circ}$, while the $\mathrm{S} 11-\mathrm{C} 11-\mathrm{N} 11$ moiety is virtually linear [179.6 (3) ${ }^{\circ}$ ].

The $\mathrm{P}-\mathrm{C} 1, \mathrm{P}-\mathrm{C} 2$ and $\mathrm{P}-\mathrm{C} 3$ bond distances do not differ significantly $[1.837(2), 1.834(2)$ and $1.839(2) \AA$, respectively], whereas the $\mathrm{N} 1-\mathrm{C} 1, \mathrm{~N} 2-\mathrm{C} 2$ and $\mathrm{N} 3-\mathrm{C} 3$ bond distances show deviations; the longer $\mathrm{N} 2-\mathrm{C} 2$ bond [1.498 (3) A versus 1.467 (3) and 1.470 (3) $\AA$ for N3-C3 and $\mathrm{N} 1-\mathrm{C} 1$ ] is observed because atom N 2 is protonated. This protonated $\mathrm{N} 2-\mathrm{H} 2$ moiety in turn participates in a fairly strong intermolecular interaction with atom N 11 of an adjacent $\mathrm{NCS}^{-}$counter-ion $\left[\mathrm{N} 2-\mathrm{H} 2=0.87(2) \AA, \mathrm{H} 2 \cdots \mathrm{~N} 11^{*}=\right.$ 1.86 (2) $\AA, \mathrm{N} 2 \cdots \mathrm{~N} 11^{*}=2.724$ (3) $\AA$ and $\mathrm{N} 2-\mathrm{H} 2 \cdots \mathrm{~N} 11^{*}=$ 175 (2) ${ }^{\circ}$; symmetry code: $\left({ }^{*}\right) \frac{1}{2}+x,-\frac{1}{2}-y,-\frac{1}{2}+z$ ] (see also Fig. 2).

Figure 2
A section of the unit cell of (I), showing the packing and the $\mathrm{H} 2 \cdots \mathrm{~N} 11^{*}$ and S $11 \cdots$ Pd interactions. [Symmetry code: (*) $\frac{1}{2}+x,-\frac{1}{2}-y,-\frac{1}{2}+z$.]

The effective cone angle $\left(\theta_{\mathrm{E}}\right)$ for the PTA ligand in (I) was calculated as $114.5^{\circ}$ using the real $\mathrm{Pd}-\mathrm{P}$ distance (Otto et al., 2000). The Tolman cone angle $\left(\theta_{\mathrm{T}}\right)$ was calculated as $114.8^{\circ}$, using a $\mathrm{Pd}-\mathrm{P}$ distance of $2.28 \AA$, according to the original definition (Tolman, 1977). This value is comparable to the values of $\theta_{\mathrm{E}}$ and $\theta_{\mathrm{T}}$ calculated for PTA in trans $-\left[\mathrm{PdBr}_{2}(\mathrm{PTA})_{2}\right]$ (114.0 and $115.1^{\circ}$; Meij et al., 2002), $\left[\mathrm{PtI}_{2}(\mathrm{PTA})_{3}\right](118.3$ and $119.2^{\circ}$; Otto \& Roodt, 2001a) and trans- $\left[\mathrm{PtI}_{2}(\mathrm{PTA})_{2}\right]$ (117.3 and $118.2^{\circ}$; Otto \& Roodt, 2001b), thus confirming the rigid character of the ligand.

## Experimental

To an aqueous solution of $c i s-\left[\mathrm{PdCl}_{2}(\mathrm{PTA})_{2}\right](2.5 \mathrm{mg}, 0.005 \mathrm{mmol})$ at $\mathrm{pH} 3.0-3.5\left(\mathrm{HClO}_{4}\right)$ was added an excess ( $>10$ times) of KSCN ( $100 \mathrm{mg}, 1.03 \mathrm{mmol}$ ). Evaporation of the solution at ambient temperature gave red crystals suitable for X-ray analysis. IR ( KBr ): $\nu(\mathrm{SCN}) 2044 \mathrm{~cm}^{-1}$.

Methylene H atoms were placed in idealized positions ( $\mathrm{C}-$ $\mathrm{H}=0.97-0.98 \AA$ ) and constrained to ride on their parent atoms, with $U_{\text {iso }}(\mathrm{H})$ values of $1.2 U_{\text {eq }}(\mathrm{C})$. The position of the H atom on atom N 2 was determined from a Fourier difference map and the coordinates were refined with an isotropic displacement parameter constrained to $1.2 U_{\text {eq }}(\mathrm{N})$.
