The title polymeric complex, poly[tetraaquatricadmium(II)-hexa- $\mu$-nicotinato], $\left[\mathrm{Cd}_{3}\left(\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{NO}_{2}\right)_{6}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]_{n}$, exhibits two types of metal centers, i.e. a seven-coordinated Cd atom and a six-coordinated Cd atom located on an inversion center. The seven-coordinated Cd atoms are linked by $\kappa^{3} N: O, O^{\prime}$-nicotinate bridges into one-dimensional chains that are further linked by $\kappa^{2} N, O$-nicotinate- $\mathrm{Cd} 2-\kappa^{2} N, O$-nicotinate bridges into a two-dimensional network which is parallel to the $x y$ plane and which contains large 24 - and 36 -membered rings.

## Comment

In recent years, the $m$-pyridinecarboxylate (nicotinate) group has been used as a bi/tridentate ligand to build coordination polymers for exploring non-linear optical and magnetic materials (Lin et al., 2000; Chen et al., 2001; Evans \& Lin, 2001). In these reported coordination polymers, the metal atoms exhibit different types of coordination geometry, viz. pentagonal bipyramidal in poly[aquacadmium-bis ( $\eta$-nicotinato)] (Clegg et al., 1995), octahedral in poly[manganese-bis ( $\eta$ nicotinato)] (Wang et al., 2002) and distorted square pyramidal in two three-dimensional coordination polymers built from a nicotinate group and binuclear copper(II)/cadmium(II), namely poly[copper(II)/cadmium(II)-bis( $\eta$-nicotinato)] (Lu \& Babb, 2001; Lu \& Kohler, 2002). Only one type of metal center is found in all of the coordination polymers mentioned above.

In this work, we report a new two-dimensional $\mathrm{Cd}^{\mathrm{II}}$ coordination polymer, $v i z$. poly[tetraaquatricadmium(II)-hexa- $\mu$ nicotinato], (I), featuring a binuclear $\mathrm{Cd}^{\mathrm{II}}$ unit with both seven- and six-coordination geometries. The seven-coordinated Cd1 atom in (I) occupies a very distorted pentagonal bipyramidal coordination environment. Four O atoms of two nicotinate groups $[\mathrm{Cd} 1-\mathrm{O} 1=2.348(4) \AA, \quad \mathrm{Cd} 1-\mathrm{O} 2=$ $2.539(5) \AA, \quad \mathrm{Cd} 1-\mathrm{O} 3^{\mathrm{i}}=2.483(4) \AA$ and $\mathrm{Cd} 1-\mathrm{O} 4^{\mathrm{i}}=$ 2.367 (4) Å; symmetry code: (i) $x, 1+y, z$; Fig. 1 and Table 1] and a nicotinate N atom $[\mathrm{Cd} 1-\mathrm{N} 2=2.396(4) \AA]$ are located at the equatorial positions, and an O atom of a coordinated water molecule [Cd1-O1W = 2.292 (4) $\AA$ ] and an N atom of another nicotinate group $\left[\mathrm{Cd} 1-\mathrm{N} 3^{\mathrm{ii}}=2.422\right.$ (4) $\AA$; symmetry
code: (ii) $1-x,-y, 1-z]$ are at the apical positions. At the equatorial positions, the coordinating O and N atoms are almost coplanar, and atom Cd1 is $0.288 \AA$ above the plane; however, the alignment of the N and O atoms at the

(I)
apical positions deviates from $180^{\circ}$ [ $\mathrm{N} 3{ }^{\mathrm{ii}}-\mathrm{Cd} 1-\mathrm{O} 1 W=$ $\left.163.72(13)^{\circ}\right]$. On the other hand, the coordination environment of atom Cd2, located on an inversion centre, is distorted octahedral. Atom Cd 2 is coordinated by two N atoms from two nicotinate groups $[\mathrm{Cd} 2-\mathrm{N} 1=2.325(5) \AA$ ] and two O atoms from another two nicotinate groups $[\mathrm{Cd} 2-\mathrm{O} 5=$ 2.268 (4) $\AA$ ] at the equatorial positions, and by two water molecules [Cd2-O2W $=2.377$ (4) $\AA$ ] at the apical positions.

Figure 1
The coordination environment in (I), showing displacement ellipsoids at the $30 \%$ probability level. [Symmetry codes: (i) $x, 1+y, z$; (ii) $1-x,-y$, $1-z$; (vi) $-x,-1-y, 1-z$.]

Figure 2
A view of the three-dimensional framework of (I). The nicotinate groups are represented by Y-shaped sticks for clarity.

Adjacent Cd 1 ions are connected by $\kappa^{3} N: O O^{\prime}$-nicotinate bridges, thus forming infinite one-dimensional chains. These chains are linked by $\kappa^{2} N, O$-nicotinate- $\mathrm{Cd} 2-\kappa^{2} N, O$-nicotinate bridges into two-dimensional zigzag sheets. In these sheets, large 36 -membered rings, with ca $17.82 \times 8.20 \AA$ internal dimensions, are formed. Two zigzag sheets are then connected by common Cd1 atoms via covalent bonds, thus forming double-layered sheets containing 24 -membered rings (Fig. 2). The 36- and 24-membered rings in (I) are larger than the 24and eight-membered rings in poly[copper(II)/cadmium(II)-$\operatorname{bis}(\eta$-nicotinato)] (Lu \& Babb, 2001; Lu \& Kohler, 2002). Finally, the two-dimensional double-layered sheets are further linked by hydrogen bonds between O atoms from both lattice water molecules and the coordinated nicotinate groups into a three-dimensional network (see Table 2 for details).

## Experimental

An aqueous solution $(9 \mathrm{ml})$ of $\mathrm{Cd}\left(\mathrm{NO}_{3}\right)_{2}(0.5 \mathrm{mmol})$ and nicotinic acid ( 1.0 mmol ) was placed in a Teflon-lined stainless steel Parr vessel ( 23 ml ). The pH of the solution was adjusted to $\sim 8.0$ with an aqueous solution $(0.2 M)$ of sodium hydrate. The vessel was sealed, heated at 423 K for 24 h , cooled at a rate of $5 \mathrm{~K} \mathrm{~h}^{-1}$ to 353 K , maintained at this temperature for 10 h and then cooled slowly to room temperature. Pale yellow crystals suitable for X-ray diffraction were obtained [yield $39 \%$ based on $\mathrm{Cd}\left(\mathrm{NO}_{3}\right)_{2}$ ]. Analysis calculated for $\mathrm{C}_{36} \mathrm{H}_{32}-$ $\mathrm{Cd}_{3} \mathrm{~N}_{6} \mathrm{O}_{16}$ : C 37.87, H $2.82, \mathrm{~N} 7.36 \%$; found: C 37.93, H 2.91 , N $7.19 \%$. IR ( $\mathrm{cm}^{-1}$ ): $3265(s), 1611(s), 1566(s), 1387(v s), 1050(m), 842(m)$, 765 (m), 699 ( $m$ ).
