The title compound, $\mathrm{C}_{10} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{~S}_{2}$, acts as an important precursor for the synthesis of the pharmaceutically important diaminedithiol ligand system. The molecule has a local twofold axis and the arrangement of the $\mathrm{S}_{2} \mathrm{~N}_{2}$ donor atoms in the macrocycle is anticlinal.

## Comment

The diaminedithiol ligand system had been employed for complexation with ${ }^{99 m} \mathrm{Tc}$ to produce significant radiopharmaceuticals (Lever et al., 1985; Cheesman et al., 1988; Kung et al., 1989; Scheffel et al., 1998). Diaminedithiol ligands have also been synthetically modified into bifunctional chelating agents for carrying ${ }^{99 m} \mathrm{Tc}$, as well as for coupling to bioactive molecules, such as proteins, antibodies and peptides (Baidoo \& Lever, 1990; Baidoo et al., 1998). ${ }^{99 m} \mathrm{Tc}$-labelled biomolecules exhibit the potential for use in non-invasive in vivo imaging of cancers (Baidoo et al., 1998). In the synthesis of diaminedithiol ligands, or of derivatives that are bifunctional chelating agents, the title compound, (I), is an important precursor. We describe here the preparation of (I) and its X-ray crystal structure, which may further support its identification by NMR and elemental analysis. The cyclic structure of (I) is in contrast with the linear structure of the diaminedithiol compound obtained from a reduction reaction of (I) (Baidoo \& Lever, 1990; Baidoo et al., 1998).

(I)

In (I), two symmetrical aliphatic units $\left(\mathrm{Me}_{2} \mathrm{C}-\mathrm{C}=\mathrm{N}-\mathrm{C}\right)$ of nearly identical geometry are connected by an $\mathrm{S} 1-\mathrm{S} 2$ bond [2.0201 (10) $\AA$ ] , thus forming a four-atom-donor macrocycle (Fig. 1). The $\mathrm{S} 1-\mathrm{S} 2$ bond length is slightly shorter than that in

6-ethoxycarbonyl-3,3,10,10-tetramethyl-1,2-dithia-5,8-diaza-deca-4,8-diene [2.025 (1) Å; Wrench et al., 1993]. This shorter length may be mainly due to the intermolecular interaction of the outward-branched 6-ethoxycarbonyl group from the ring in the latter compound. The molecule contains two double bonds $(\mathrm{C} 4=\mathrm{N} 5$ and $\mathrm{C} 9=\mathrm{N} 8)$, with essentially planar atomic

Figure 1

arrangements $\left[\mathrm{C} 3-\mathrm{C} 4=\mathrm{N} 5-\mathrm{C} 6=-171.6(2)^{\circ}\right.$ and $\mathrm{C} 7-$ $\left.\mathrm{N} 8=\mathrm{C} 9-\mathrm{C} 10=-173.3(2)^{\circ}\right]$. The torsion angles associated with the donor atoms $\left[\mathrm{N} 5=\mathrm{C} 4-\mathrm{C} 3-\mathrm{S} 2=123.8(2)^{\circ}\right.$ and $\left.\mathrm{N} 8=\mathrm{C} 9-\mathrm{C} 10-\mathrm{S} 1=123.4(2)^{\circ}\right]$ show that the donor-atom arrangement is anticlinal. The bond distances (Table 1) are in good agreement with standard values. The crystal structure is mainly stabilized by van der Waals forces, and no hydrogen bonds or $\pi-\pi$ interactions are observed.

## Experimental

The title compound was synthesized following a procedure similar to that reported by Merz \& Specker (1963), by condensation of 2,2-dithiobis(2-methylpropanal) with ethylenediamine in a $1: 5$ molar ratio. The former compound was synthesized from the reaction of isobutylaldehyde with sulfur monochloride according to the procedure reported by Baidoo (1988). The reaction was exothermic, so external cooling to keep the temperature below 298 K was needed. The resulting yellow solid was separated and washed successively with cold methanol and ether until the product became white. The white solid was then dissolved in ethyl acetate and the solution filtered, yielding a clear solution. This solution was allowed to stand at room temperature for a few days, whereupon crystals of (I) suitable for X-ray structure analysis were formed (m.p. 437-438 K). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta \mathrm{C}\left(\mathrm{CH}_{3}\right)_{2} 1.34,1.42,2 s, 12 \mathrm{H} ;=\mathrm{NCH}_{2}-\mathrm{CH}_{2} \mathrm{~N}=$ $3.20,3.23,4.11,4.14,2 d, 4 \mathrm{H} ; \mathrm{N}=\mathrm{CH} 6.84, s, 2 \mathrm{H} .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta$ 21.49, 24.67, 53.09, 61.53, 78.04. Analysis calculated for $\mathrm{C}_{10} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{~S}_{2}$ : C 52.11, H 7.87, N 12.20, S $27.82 \%$; found: C 51.95 , H 8.31, N 12.18 , S $28.81 \%$.
