The title compound, $\left[\mathrm{Pt}_{2}^{\mathrm{III}}\left(\mathrm{C}_{5} \mathrm{H}_{10} \mathrm{NO}\right)_{2}\left(\mathrm{SO}_{4}\right)_{2}\left(\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{~N}_{2}\right)_{2}\right]$-$4 \mathrm{H}_{2} \mathrm{O}$, is the first reported example of a complex in which an amidate-bridged Pt (bpy) dimer is stabilized in the oxidation level of $\mathrm{Pt}^{\mathrm{III}}$ (bpy is $2,2^{\prime}$-bipyridine). The asymmetric unit consists of one half of the formula unit with a twofold axis passing through the center of the dimer. The intradimer $\mathrm{Pt}^{\mathrm{III}}-$ $\mathrm{Pt}^{\mathrm{III}}$ bond distance $[2.5664$ (6) $\AA$ ] is comparable to those reported for $\alpha$-pyridonate-bridged cis-diammineplatinum(III) dimers [2.5401 (5)-2.5468 (8) $\AA$; Hollis \& Lippard (1983). Inorg. Chem. 22, 2605-2614], in spite of the close contact between the bpy planes within the dimeric unit. The axial $\mathrm{Pt}-$ $\mathrm{O}_{\text {sulfate }}$ distance is 2.144 (7) $\AA$.

## Comment

Amidate-bridged cis-diammineplatinum dimers, $\left[\mathrm{Pt}_{2}^{\mathrm{II}}\left(\mathrm{NH}_{3}\right)_{4}\right.$ $\left.(\mu \text {-amidato })_{2}\right]^{2+}$ (amidate is $\alpha$-pyridonate, $\alpha$-pyrrolidinonate, acetamidate, etc.), have been reported to undergo one-step two-electron oxidation to give the corresponding $\mathrm{P}_{2}^{\mathrm{III}}$ dimers, with a simultaneous uptake of two axial donors at both ends of the unit, as well as bond formation between the $\mathrm{Pt}^{\mathrm{III}}$ centers, resulting in the formation of $\left[\mathrm{Pt}_{2}^{\mathrm{III}}\left(\mathrm{NH}_{3}\right)_{4}(\mu \text {-amidato })_{2} \mathrm{X}_{2}\right]^{n+}$ ions ( $X$ is an axial donor ligand and $n$ depends on the charge of $X$ ). Reversible redox waves corresponding to the $\mathrm{Pt}_{2}^{\mathrm{II}} / \mathrm{Pt}_{2}^{\mathrm{III}}$ couple have been observed at $\sim 0.4-0.6 \mathrm{~V}$ versus SCE (Hollis \& Lippard, 1983; Matsumoto \& Matoba, 1986; Sakai et al., 1998). On the basis of the binding directions of the two amidate bridges, two geometric isomers, viz. head-to-head (HH) and head-to-tail (HT) isomers, are possible for this class of dimers. On the other hand, the dimers containing Pt (bpy) units instead of $c i s-\operatorname{Pt}\left(\mathrm{NH}_{3}\right)_{2}$ units have been shown to exhibit irreversible redox waves corresponding to the $\mathrm{Pt}_{2}^{\mathrm{II}} / \mathrm{Pt}_{2}^{\mathrm{III}}$ couple; irreversible oxidation-reduction waves were observed at $\sim 1 \mathrm{~V}$ versus SCE for HT-[ $\left.\mathrm{Pt}_{2}^{\mathrm{II}}(\mathrm{bpy})_{2}(\mu-\alpha \text {-pyrrolidinonato })_{2}\right]$ $\left(\mathrm{ClO}_{4}\right)_{2}$ (Matsumoto et al., 1992). These results suggest that
the formation of the $\mathrm{Pt}^{\mathrm{III}}-\mathrm{Pt}^{\mathrm{III}}$ single bond in the $\mathrm{Pt}(\mathrm{bpy})$ dimers is hindered by repulsive interaction between the two bpy units. We have now found, for the first time, that an 'amidate-bridged $\mathrm{Pt}^{\mathrm{III}}$ (bpy) dimer' can be isolated in a stable crystalline form, and we report here the synthesis and crystal structure of HT-[ $\left[\mathrm{Pt}_{2}^{\mathrm{III}}(\mathrm{bpy})_{2}(\mu \text {-pivalamidato })_{2}\left(\mathrm{SO}_{4}\right)_{2}\right] \cdot 4 \mathrm{H}_{2} \mathrm{O}$, (I).

(I)

The asymmetric unit of (I) consists of one-half of the formula unit (Fig. 1). A twofold axis passes through the center of the dimeric unit. There is, therefore, a crystallographic requirement that this is a head-to-tail isomer. Analysis of the isotropic atomic displacement parameters of the O - and N -donors of pivalamidate revealed no evidence for any disorder of the O and NH moieties (see Experimental). The hydrogen-bonding geometry given in Table 3 also supports the validity of our treatment with regard to the binding direction of pivalamidate. To the best of our knowledge, this is the first structural characterization of a diplatinum(III) complex capped by two sulfate ions, even though stepwise axial sulfateligation equilibria were previously investigated for an $\alpha$-pyr-

rolidinonate-bridged cis-diammineplatinum(III) dimer by means of spectrophotometric titration (Sakai, Tsubomura \& Matsumoto, 1993).

The intradimer $\mathrm{Pt}^{\mathrm{III}}-\mathrm{Pt}^{\mathrm{III}}$ distance in (I) $\left[\mathrm{Pt} 1-\mathrm{Pt}^{1}{ }^{\mathrm{i}}=\right.$ 2.5664 (6) $\AA$; symmetry code: (i) $-x, y, \frac{3}{2}-z$ ] is unexpectedly short, in spite of the steric hindrance promoted between the bpy planes within the dimeric unit, and is comparable to those reported for $\alpha$-pyridonate-bridged cis-diammineplatinum(III) dimers $\left\{\mathrm{Pt}^{\mathrm{III}}-\mathrm{Pt}^{\mathrm{III}}=2.5401\right.$ (5) $\AA$ for $\mathrm{HH}-\left[\mathrm{Pt}_{2}^{\mathrm{III}}\left(\mathrm{NH}_{3}\right)_{4}\right.$ -$\left.\left(\mu-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{NO}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)\left(\mathrm{NO}_{3}\right)\right]\left(\mathrm{NO}_{3}\right)_{3} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ and $\mathrm{Pt}^{\mathrm{III}}-\mathrm{Pt}^{\mathrm{III}}=$ $2.5468(8) \AA$ for $\quad \mathrm{HT}-\left[\mathrm{Pt}_{2}^{\mathrm{III}}\left(\mathrm{NH}_{3}\right)_{4}\left(\mu-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{NO}\right)_{2}\left(\mathrm{NO}_{3}\right)_{2}\right]$ $\left(\mathrm{NO}_{3}\right)_{2} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$ (Hollis \& Lippard, 1983) $\}$. On the other hand, the $\mathrm{Pt}^{\mathrm{III}}-\mathrm{Pt}^{\mathrm{II}}$ distance in (I) is $\sim 0.1 \AA$ shorter than those reported for $\alpha$-pyrrolidinonate-bridged cis-diammineplatinum(III) dimers $\left\{\mathrm{Pt}^{\mathrm{III}}-\mathrm{Pt}^{\mathrm{III}}=2.644\right.$ (1) $\AA$ for $\mathrm{HH}-$ $\left[\mathrm{Pt}_{2}^{\mathrm{III}}\left(\mathrm{NH}_{3}\right)_{4}\left(\mu-\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{NO}\right)_{2}\left(\mathrm{NO}_{2}\right)\left(\mathrm{NO}_{3}\right)\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ (Abe et

## Figure 2

The structure of $(\mathrm{I})$, viewed along the $\mathrm{Pt} 1-\mathrm{Pt} 1^{\mathrm{i}}$ vector. H atoms and water molecules have been omitted for clarity; only one orientation is shown for the disordered tert-butyl groups. [Symmetry code: (i) $-x, y, \frac{3}{2}-z$.]

Figure 3

al., 1991), $\mathrm{Pt}^{\mathrm{III}}-\mathrm{Pt}^{\mathrm{III}}=2.6366$ (7) $\AA$ for $\mathrm{HH}-\left[\mathrm{Pt}_{2}^{\mathrm{III}}\left(\mathrm{NH}_{3}\right)_{4}(\mu-\right.$ $\left.\left.\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{NO}\right)_{2}(\mathrm{Cl})_{2}\right]\left(\mathrm{NO}_{3}\right)_{2}$ (Sakai et al., 1998) and $\mathrm{Pt}^{\mathrm{III}}-\mathrm{Pt}^{\mathrm{III}}=$ $2.6239(9) \AA$ for $\mathrm{HH}-\left[\mathrm{Pt}_{2}^{\mathrm{III}}\left(\mathrm{NH}_{3}\right)_{4}\left(\mu-\mathrm{C}_{4} \mathrm{H}_{6} \mathrm{NO}\right)_{2}(\mathrm{Cl})\left(\mathrm{NO}_{3}\right)\right]$ $\left(\mathrm{NO}_{3}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ (Sakai et al., 1998); see also Sakai, Sakamoto et al. (2003) and Sakai et al. (2004)\}. Thus, a relatively short and strong $\mathrm{Pt}^{\mathrm{III}}-\mathrm{Pt}^{\mathrm{II}}$ bond is achieved in (I). As shown in Fig. 2 and Table 2, there are some short intramolecular bpy-bpy contacts, namely N3 $\cdot$ N $2^{i}$, N3 $\cdots \mathrm{C} 6^{i}$ and $\mathrm{C} 15 \cdots \mathrm{C} 6^{i}$.

The mean-plane calculations performed for the four-coordinated atoms ( $\mathrm{N} 1, \mathrm{~N} 2, \mathrm{~N} 3$ and $\mathrm{O} 1^{\mathrm{i}}$ ) reveal that the Pt coordination plane is slightly deformed but is roughly planar, the four-atom r.m.s. deviation being $0.029 \AA$. Atom Pt 1 is displaced from the mean plane defined by atoms N1, N2, N3 and $\mathrm{O} 1^{\mathrm{i}}$ by 0.024 (3) Å towards atom $\mathrm{Pt} 1^{\mathrm{i}}$ within the unit. The dihedral angle $(\tau)$ between the two Pt coordination planes within the dimeric unit and their mean torsional twist $(\omega)$ about the $\mathrm{Pt}-\mathrm{Pt}$ axis are 17.1 (3) and 16.8 (4) ${ }^{\circ}$, respectively (see Fig. 2; see also torsion angles in Table 1). The dihedral angle between the two bpy planes within the dimeric unit is $16.3(2)^{\circ}$. Thus, the bpy plane is nearly coplanar with the Pt coordination plane [they are inclined by $2.7(3)^{\circ}$ to one another].

The axial $\mathrm{Pt}^{\mathrm{III}}-\mathrm{O}_{\text {sulfate }}$ distance [2.144 (7) $\AA$ ] is comparable to those reported for $\alpha$-pyridonate-bridged cis-diammineplatinum(III) dimers $\left\{\mathrm{Pt}^{\mathrm{III}}-\mathrm{O}\left(\right.\right.$ axial $\left.\mathrm{H}_{2} \mathrm{O}\right)=2.122(6) \AA$ and $\mathrm{Pt}^{\mathrm{III}}-\mathrm{O}\left(\right.$ axial $\left.\mathrm{NO}_{3}{ }^{-}\right)=2.193(7) \AA$ for $\mathrm{HH}-\left[\mathrm{Pt}_{2}^{\mathrm{III}}\left(\mathrm{NH}_{3}\right)_{4}{ }^{-}\right.$ $\left.\left(\mu-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{NO}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)\left(\mathrm{NO}_{3}\right)\right]\left(\mathrm{NO}_{3}\right)_{3} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, and $\mathrm{Pt}^{\mathrm{III}}-\mathrm{O}($ axial $\left.\mathrm{NO}_{3}{ }^{-}\right)=2.17(1) \AA$ for $\mathrm{HT}-\left[\mathrm{Pt}_{2}^{\mathrm{III}}\left(\mathrm{NH}_{3}\right)_{4}\left(\mu-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{NO}\right)_{2}{ }^{-}\right.$ $\left.\left(\mathrm{NO}_{3}\right)_{2}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$ (Hollis \& Lippard, 1983)\}.

As shown in Fig. 3, the crystal packing is partly stabilized by relatively weak hydrophobic interactions between the tertiary butyl moieties and the bpy units, where the shortest intermolecular bpy...bpy separation is 3.69 (1) $\AA$. The dimerdimer interactions along the $c$ axis are also stabilized by $\mathrm{O}_{\text {sulfate }} \cdots \mathrm{O}_{\text {water }} \cdots \mathrm{O}_{\text {water }} \cdots \mathrm{O}_{\text {sulfate }}$ hydrogen bonds [i.e. O5..O7..O $6^{\mathrm{ii}} \cdots \mathrm{O}^{\mathrm{ii}}$, where $\mathrm{O} 5 \cdots \mathrm{O} 7=2.750(12) \AA$, $\mathrm{O} 7 \cdots \mathrm{O} 6^{\mathrm{ii}}=2.784(14) \AA$ and $\mathrm{O}^{\mathrm{iii}} \cdots \mathrm{O}^{\mathrm{ii}}=2.864$ (13) $\AA$; symmetry code: (ii) $x, 2-y, z-\frac{1}{2}$; see also Table 2]. The dimer is also connected to a neighboring dimer via an inversion center by forming $\mathrm{O}_{\text {sulfate }} \cdots \mathrm{O}_{\text {water }} \cdots \mathrm{O}_{\text {sulfate }}$ hydrogen bonds [i.e. O5 $\cdots \mathrm{O} 7 \cdots \mathrm{O} 4\left(\frac{1}{2}-x, \frac{5}{2}-y, 2-z\right) ; \mathrm{O} 7 \cdots \mathrm{O} 4\left(\frac{1}{2}-x, \frac{5}{2}-y\right.$, $2-z)=2.828$ (12) A; see also Table 2].

## Experimental

For the synthesis of (II), a suspension of $\mathrm{PtCl}_{2}$ (bpy) ( $1 \mathrm{mmol}, 0.42 \mathrm{~g}$; Morgen \& Burstall, 1934), $\mathrm{AgNO}_{3}(2 \mathrm{mmol}, 0.34 \mathrm{~g})$ and pivalamide $(1.5 \mathrm{mmol}, 0.15 \mathrm{~g})$ in water $(7 \mathrm{ml})$ was refluxed for 3 h in the dark, during which time the color of the solution turned deep red. The solution was then filtered while it was hot in order to remove the precipitated AgCl . Leaving the filtrate at room temperature overnight afforded (II) as deep-red block-like crystals, which were collected by filtration and air-dried (yield $65 \%$ ). Complex (II) was purified by recrystallization from hot water [compound (II) ( 0.1 g ) was dissolved in $\sim 1 \mathrm{ml}$ of water; $\sim 80 \%$ of the product was recollected]. Analysis calculated for $\mathrm{C}_{30} \mathrm{H}_{46} \mathrm{~N}_{8} \mathrm{O}_{13} \mathrm{Pt}_{2}$ : C 32.26, H 4.15, N $10.03 \%$; found: C 32.30, H 3.91, N 9.99\%. IR (KBr, $\mathrm{cm}^{-1}$ ): 3421 ( $w$, br), 2360 ( $m$ ), 2341 (w), 1607 (w), 1560 (m), 1489 (w), 1454 (w), 1384 (s), $1188(w), 1029(w, b r), 769(m), 722(m), 650(m, b r), 419(w) . U V-$

Vis (in $\left.\mathrm{H}_{2} \mathrm{O}, 293 \mathrm{~K}\right)$ : $\lambda_{\text {max }}=306 \mathrm{~nm}\left(\varepsilon=20400 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$, $\lambda_{\max }=$ $361 \mathrm{~nm}\left(\varepsilon=2080 M^{-1} \mathrm{~cm}^{-1}\right), \lambda_{\max }=475 \mathrm{~nm}\left(\varepsilon=2110 M^{-1} \mathrm{~cm}^{-1}\right)$. ${ }^{195} \mathrm{Pt}$ NMR $\left(\mathrm{D}_{2} \mathrm{O}, 296 \mathrm{~K}\right.$, referenced to -1624 p.p.m. of $\left.\mathrm{K}_{2} \mathrm{PtCl}_{4}\right)$ : -2064 p.p.m. (singlet characteristic of HT). Complex (II) was confirmed to be a head-to-tail isomer, part of which was reported by Sakai, Takeshita \& Tsubomura (1993). For the synthesis of (I), a solution of (II) $(0.25 \mathrm{mmol}, 0.28 \mathrm{~g})$ and $\mathrm{K}_{2} \mathrm{~S}_{2} \mathrm{O}_{8}(0.3 \mathrm{mmol}, 0.08 \mathrm{~g})$ in water ( 15 ml ) was stirred at room temperature for 15 min . The solution was filtered to remove impurities and then evaporated to dryness. The yellow powder deposited was redissolved in a minimum amount of water ( $\sim 3 \mathrm{ml}$ ). Leaving the solution to stand in air at room temperature for a few days afforded (I) as yellow prisms, which were collected by filtration and air-dried by suction (yield 68\%). Analysis calculated for $\mathrm{C}_{30} \mathrm{H}_{44} \mathrm{~N}_{6} \mathrm{O}_{14} \mathrm{Pt}_{2} \mathrm{~S}_{2}$ : C 30.88, H 3.80, N 7.20\%; found: C 30.82, H 3.10, N $7.09 \%$. IR ( $\mathrm{KBr}, \mathrm{cm}^{-1}$ ): $3440(m, b r), 3077(w, b r)$, 2962 ( $w$ ), 1606 ( $m$ ), 1581 ( $m$ ), 1503 ( $w$ ), 1454 ( $m$ ), 1426 ( $w), 1370(w)$, 1313 (w), 1253 (w), 1182 (s), 1117 (vs), 1076 (w), 1051 (w), 1012 (vs), $917(m), 873(s), 777(m), 614(m), 587(w)$. The crystals were stable in air at room temperature. A diffraction-quality single crystal was mounted on a glass fiber and used in the data collection.

As recently reported for several different dimers doubly bridged by chain amidate ligands (Sakai, Kurashima et al., 2003; Sakai, Ikuta et al., 2003; Sakai, Shiomi et al., 2003), it is often possible to determine the binding direction of the O - and N -donors of each amidate on the basis of the results of least-squares calculations performed for two possible directions. Moreover, when the $U_{\text {eq }}$ values of Pt atoms are reasonably small, a disorder model based on the mixing of HH and HT isomers is not favored, since the intradimer $\mathrm{Pt}-\mathrm{Pt}$ distances of the HH and HT isomers are, in general, markedly different from one another (Sakai et al., 1998). In (I), atom Pt1 has a reasonably small $U_{\text {eq }}$ value $\left[0.02294(15) \AA^{2}\right]$, indicating that the mixing of the HH and HT isomers is not likely to be promoted in this system. The locations of atoms O 1 and N 1 have been determined rationally from the comparison of two sets of $U_{\text {eq }}$ values, viz. $U_{\text {eq }}(\mathrm{O} 1)=0.0277$ (12) $\AA^{2}$ and $U_{\text {eq }}(\mathrm{N} 1)=0.0273(15) \AA^{2}$, and $U_{\text {eq }}(\mathrm{N}$ instead of O 1$)=$ $0.0152(12) \AA^{2}$ and $U_{\text {eq }}(\mathrm{O}$ instead of N 1$)=0.0448(18) \AA^{2}$. The former set, corresponding to the reported combination, clearly shows a good balance and was therefore adopted as a reasonable set. As a result, the H atom on atom N 1 was located at an idealized position as a riding atom, as mentioned below. The tertiary butyl group shows orientational disorder in which two sets of positions (C3A/C4A/C5A and $\mathrm{C} 3 B / \mathrm{C} 4 B / \mathrm{C} 5 B$ ) are located around atom C 2 . The disordered C atoms were assumed to have the same isotropic displacement parameter. Furthermore, all six $\mathrm{C}_{\text {tertiary }}-\mathrm{C}_{\text {methyl }}$ distances within each site were restrained to be equal, as were the three $\mathrm{C}_{\text {methyl }}-\mathrm{C}_{\text {methyl }}$ distances. The occupation factors of sites $A$ and $B$ converged at 70.7 (15) and 29.3 (15)\%, respectively. All H atoms, except for those of water molecules, were located at their idealized positions as riding atoms $[\mathrm{C}-\mathrm{H}=0.93 \AA$ (for aromatic H atoms), $\mathrm{C}-\mathrm{H}=0.96 \AA$ (for methyl H atoms) and $\mathrm{N}-\mathrm{H}=0.86 \AA$ ] and included in the refinement in the riding-motion approximation [with $U_{\text {iso }}(H)=1.2 U_{\text {eq }}$ (carrier atom)]. Water H atoms were not located. In the final difference Fourier synthesis, 32 residual peaks in the range $1.02-2.78$ e $\AA^{-3}$ were observed, not only within $1.4 \AA$ of atom Pt 1 but also near atoms O 2 , $\mathrm{O} 3, \mathrm{O} 4, \mathrm{O} 5, \mathrm{O} 6, \mathrm{O} 7, \mathrm{C} 2, \mathrm{C} 11$ and C13. The deepest hole was located $0.54 \AA$ from atom Pt1.

Data collection: SMART (Bruker, 2001); cell refinement: SAINT (Bruker, 2001); data reduction: SAINT; program(s) used to solve structure: SHELXS97 (Sheldrick, 1997); program(s) used to refine
structure: SHELXL97 (Sheldrick, 1997); molecular graphics: KENX (Sakai, 2002); software used to prepare material for publication: SHELXL97, TEXSAN (Molecular Structure Corporation, 2001), KENX and ORTEPII (Johnson, 1976).

This work was partly supported by a Grant-in-Aid for Scientific Research (B) (No. 14340223) from the Ministry of Education, Culture, Sports, Science and Technology of Japan.

Supplementary data for this paper are available from the IUCr electronic archives (Reference: GD1315). Services for accessing these data are described at the back of the journal.
