5-Methyl-2-(4-methylphenyl)-7,8-dihydro-6 H -cyclopenta $[g]$ -pyrazolo[1,5-a]pyrimidine, $\mathrm{C}_{17} \mathrm{H}_{17} \mathrm{~N}_{3}$, 2-(4-chlorophenyl)-5-methyl-7,8-dihydro- 6 H -cyclopenta $[g]$ pyrazolo $[1,5-a$ ]pyrimidine, $\mathrm{C}_{16} \mathrm{H}_{14} \mathrm{ClN}_{3}$, and 2-(4-bromophenyl)-5-methyl-7,8-dihy-dro- $6 H$-cyclopenta $[g]$ pyrazolo $[1,5-a]$ pyrimidine, $\mathrm{C}_{16} \mathrm{H}_{14} \mathrm{BrN}_{3}$, are isostructural; in each compound, the molecules are linked into chains by a single $\mathrm{C}-\mathrm{H} \cdots \pi$ (arene) hydrogen bond. Molecules of 2-(4-methoxyphenyl)-5-methyl-7,8-dihydro-6 H -cyclopenta[g]pyrazolo[1,5-a]pyrimidine, $\quad \mathrm{C}_{17} \mathrm{H}_{17} \mathrm{~N}_{3} \mathrm{O}$, are linked by a single $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond into chains, which are themselves linked into sheets by a $\pi-\pi$ stacking interaction.

## Comment

Pyrazolo[1,5-a]pyrimidines are purine analogues which have shown useful properties as antimetabolites, and which have been of pharmaceutical interest because of their antitrypanosomal activity (Novinson et al., 1976) and their anti-
schistosomal activity (Senga et al., 1981). These interesting biological properties have prompted the search for new and efficient procedures of wide generality for the synthesis of pyrazolo[1,5-a]pyrimidine derivatives (Al-Shiekh et al., 2004; Makarov et al., 2005). We report here the structures of four cyclopenta $[g]$ pyrazolo $[1,5-a$ ]pyrimidines, namely 5-methyl-2-(4-methylphenyl)-7,8-dihydro-6 H -cyclopenta $[g]$ pyrazolo[1,5a]pyrimidine, (I), 2-(4-chlorophenyl)-5-methyl-7,8-dihydro6 H -cyclopenta $[g]$ pyrazolo 1,5 -a]pyrimidine, (II), 2-(4-bromo-phenyl)-5-methyl-7,8-dihydro-6 H -cyclopenta $[g]$ pyrazolo[1,5a]pyrimidine, (III), and 2-(4-methoxyphenyl)-5-methyl-7,8-dihydro- 6 H -cyclopenta $[g]$ pyrazolo $1,5-a]$ pyrimidine, (IV), prepared by solvent-free cyclocondensation reactions between 5 -amino- 1 H -pyrazole derivatives and 2 -acetylcyclopentanone, induced by microwave irradiation.

(I) $R=\mathrm{Mc}$
(II) $R=\mathrm{Cl}$
(111) $R=\mathrm{Br}$
(IV) $R=\mathrm{OMc}$

Compounds (I)-(III) form isomorphous crystals, and the compounds are isostructural. This fact is consistent with the similar steric requirements of methyl, chloro and bromo substituents, as reflected, for example, in the similar unit-cell dimensions of (I)-(III).

The corresponding bond lengths within the heterobicyclic fragments in compounds (I)-(IV) (Figs. 1-4) are very similar (Table 1), but the patterns of these bond distances show some

Figure 1
The molecule of (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level.

Figure 2
The molecule of (II), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level.
interesting properties. In each of (I)-(IV), the $\mathrm{N} 1-\mathrm{C} 2$ bond, which is formally a double bond, is not significantly shorter than the $\mathrm{C} 3 A-\mathrm{N} 4$ and $\mathrm{C} 8 A-\mathrm{N} 8 B$ bonds, both of which are formally single bonds; at the same time, the cross-ring bonds $\mathrm{C} 3 A-\mathrm{N} 8 B$ are by far the longest $\mathrm{C}-\mathrm{N}$ bond in any molecule. These observations, together with the clear bond fixation in the pyrimidine ring, suggest that the ten $\pi$ electrons of the pyrazolopyrimidine units are not fully delocalized around the periphery, but instead adopt a more characteristic arrangement, reminiscent of that in naphthalene.

In all of these compounds, the five-membered carbocyclic ring has an envelope conformation, with the fold across the line $\mathrm{C} 6 \cdots \mathrm{C}$; the total puckering amplitude $Q$ (Cremer \& Pople, 1975) is larger in (III) $[0.231$ (4) $\AA]$ than in any of (I) [0.111 (3) A] , (II) [0.159 (3) Å] or (IV) [0.095 (2) Å], but in each case the ring-puckering parameter $\varphi_{2}\left[257.1\right.$ (14) ${ }^{\circ}$ in (I), $255.0(10)^{\circ}$ in (II), 73.3 (8) ${ }^{\circ}$ in (III) and $73.6(8)^{\circ}$ in (IV) for the atom sequence $\mathrm{C} 5 A-\mathrm{C} 6-\mathrm{C} 7-\mathrm{C} 8-\mathrm{C} 8 A]$ is very close to the ideal value of $36 n^{\circ}$ (Evans \& Boeyens, 1989), with $n=7$ in (I) and (II), and $n=2$ in (III) and (IV). The 4-substituted C21C26 aryl ring is nearly coplanar with the heterobicyclic ring system in each of (I)-(IV); thus, the dihedral angles between the aryl ring and the mean plane of the pyrazolopyrimidine ring system are $12.0(2)^{\circ}$ in (I), 14.5 (2) ${ }^{\circ}$ in (II), $14.2(2)^{\circ}$ in (III) and $3.6(2)^{\circ}$ in (IV). In compound (IV), methoxy atom C241 is nearly coplanar with the aryl ring and, consistent with this, the exocyclic $\mathrm{C}-\mathrm{C}-\mathrm{O}$ angles at atom C 24 show the usual deviations from $120^{\circ}$ (Table 1).

Figure 3
The molecule of (III), showing the atom-labelling scheme. For clarity, only the major orientation of the disordered $\mathrm{CH}_{2}$ group is shown. Displacement ellipsoids are drawn at the $30 \%$ probability level.

Figure 4
The molecule of (IV), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level.

Despite the strong similarities between compounds (I)-(IV) in terms both of their overall constitutions and of their intramolecular geometries and conformations, the pattern of supramolecular aggregation in compound (IV) is very different from that in the isostructural trio (I)-(III), both from the point of view of the direction-specific interactions present and in terms of their overall supramolecular structures.

In each of compounds (I)-(III), the molecules are linked into chains by a single $\mathrm{C}-\mathrm{H} \cdots \pi$ (arene) hydrogen bond (Table 2); atom C6 in the molecule at $(x, y, z)$ acts as a donor, via atom $\mathrm{H} 6 A$, to the pyrazole ring in the molecule at ( $x$, $-1+y, z$ ), so generating by translation a chain running parallel to the [010] direction (Fig. 5). It should be noted that $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ and, in (II) and (III), $\mathrm{C}-\mathrm{H} \cdots$ halogen hydrogen bonds, as well as aromatic $\pi-\pi$ stacking interactions, are all absent from the structures of (I)-(III).

By contrast, in compound (IV), the molecules are linked into chains by a $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bond (Table 2), and these chains are themselves linked into sheets by a $\pi-\pi$ stacking interaction. Aryl atom C22 in the molecule at $(x, y, z)$ acts as a hydrogen-bond donor to pyrimidine atom N 4 in the molecule at $\left(1-x,-\frac{1}{2}+y, \frac{1}{2}-z\right)$, so forming a $C(7)$ chain running parallel to the [010] direction and generated by the $2_{1}$ screw axis along $\left(\frac{1}{2}, y, \frac{1}{4}\right)$ (Fig. 6). The $\pi-\pi$ stacking interaction involves the fused heterocyclic rings of the molecules at $(x, y$, $z$ ) and (1-x,2-y,-z), where the interplanar spacing is

Figure 5
Part of the crystal structure of (I), showing the formation via C $\mathrm{H} \cdots \pi$ (arene) hydrogen bonds (dashed lines) of a chain along [010]. For clarity, H atoms bonded to those C atoms that are not involved in the motif shown have been omitted. Atoms marked with an asterisk (*) or a hash (\#) are at the symmetry positions $(x,-1+y, z)$ and $(x, 1+y, z)$, respectively. The [010] chains in (II) and (III) are essentially identical to that in (I).
3.504 (2) $\AA$; the ring-centroid separation of the pyrazole and pyrimidine rings, respectively, is 3.577 (2) $\AA$, corresponding to a ring-centroid offset of 0.719 (2) $\AA$; the corresponding separation of the pyrimidine centroids is 3.799 (2) $\AA$, with a centroid offset of 1.489 (2) $\AA$. These two molecules lie in the $C(7)$ chains along $\left(\frac{1}{2}, y, \frac{1}{4}\right)$ and $\left(\frac{1}{2}, y,-\frac{1}{4}\right)$, respectively, and propagation by the space group of this stacking interaction generates a sheet lying parallel to (100) (Fig. 7).

It is striking that, although the substituents in the aryl rings, viz. 4-methyl in (I), 4-chloro in (II), 4-bromo in (III) and 4methoxy in (IV), play no direct role whatever in the supramolecular aggregation, nonetheless the types of directionspecific intermolecular interaction apparent in the crystal structures of (I)-(III) are entirely different from those

Figure 6
Part of the crystal structure of (IV), showing the formation via $\mathrm{C}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds (dashed lines) of a $C(7)$ chain along [010]. For clarity, H atoms not involved in the motif shown have been omitted. Atoms marked with an asterisk $(*)$ or a hash (\#) are at the symmetry positions ( $1-x$, $\left.-\frac{1}{2}+y, \frac{1}{2}-z\right)$ and $\left(1-x, \frac{1}{2}+y, \frac{1}{2}-z\right)$, respectively.

Figure 7
A stereoview of part of the crystal structure of compound (IV), showing the formation of a (100) sheet of $\pi$-stacked [010] chains. For clarity, H atoms not involved in the motif shown have been omitted.
apparent in the structure of (IV). The influence of these remote substituents on the supramolecular structures thus appears to be indirect and rather subtle, but real nonetheless; such subtle influences necessarily hinder the effective prediction of such structures.

## Experimental

Equimolar mixtures of the appropriate 5 -amino-3-aryl-1 H -pyrazole ( 2.6 mmol ) [where aryl is 4-methylphenyl for (I), 4-chlorophenyl for (II), 4-bromophenyl for (III) and 4-methoxyphenyl for (IV)] and 2-acetylcyclopentanone ( 2.6 mmol ) were placed in open Pyrex glass vessels and irradiated in a domestic microwave oven for $1.5-2$ min at 600 W . The product mixtures were extracted with ethanol and, after removal of the solvent, the resulting solids were recrystallized from dimethylformamide to give crystals of (I)-(IV) suitable for singlecrystal X-ray diffraction. For (I), m.p. $512-513 \mathrm{~K}$, yield $80 \%$; MS ( 30 eV ) $\mathrm{m} / \mathrm{z}$ (\%): 263 ( $100, M^{+}$), 248 (4). For (II), m.p. 496-497 K, yield $83 \%$; MS ( 30 eV ) m/z (\%): 285/283 (35/100, $M^{+}$), 268 (3), 241 (2). For (III), m.p. 496-497 K, yield 83\%; MS (30 eV) m/z (\%): 329/327 (97/100, $M^{+}$), 312 (3). For (IV), m.p. 497-498 K, yield $85 \%$; MS ( 30 eV ) m/z (\%): 279 (100, $M^{+}$), 264 (27), 236 (7).

For each of (I)-(IV), the space group $P 2_{1} / c$ was uniquely assigned from the systematic absences. All H atoms were located from difference maps in fully ordered sites; they were then treated as riding atoms, with $\mathrm{C}-\mathrm{H}$ distances of 0.95 (aromatic), 0.98 (methyl) or $0.99 \AA\left(\mathrm{CH}_{2}\right)$, and with $U_{\text {iso }}(\mathrm{H})$ values of $1.2 U_{\mathrm{eq}}(\mathrm{C})$, or $1.5 U_{\mathrm{eq}}(\mathrm{C})$ for the methyl groups. For compounds (I) and (II), although not for (IV), the displacement parameters for atom C7 were somewhat higher than those of neighbouring C atoms, and were consistent with an enhanced vibrational amplitude approximately normal to the C6-C8 plane and tangential to the envelope fold. For compound (III), it was necessary to model this atom and its associated H atoms over two sets of sites, with refined occupancies of 0.853 (17) and 0.147 (17). The crystals of compound (III) are very fragile, and attempts to cut small fragments from larger crystals always resulted in shattering.

For all compounds, data collection: COLLECT (Hooft, 1999); cell refinement: DENZO (Otwinowski \& Minor, 1997) and COLLECT; data reduction: DENZO and COLLECT; program(s) used to solve structure: WinGX (Farrugia, 1999) and SIR92 (Altomare et al., 1993) for (I), (II) and (III), and OSCAIL (McArdle, 2003) and SHELXS97 (Sheldrick, 1997) for (IV); program(s) used to refine structure: OSCAIL and SHELXL97 (Sheldrick, 1997); molecular graphics:

## organic compounds

PLATON (Spek, 2003); software used to prepare material for publication: SHELXL97 and PRPKAPPA (Ferguson, 1999).

X-ray data were collected at the EPSRC X-ray Crystallographic Service, University of Southampton, England. JC thanks the Consejería de Innovación, Ciencia y Empresa (Junta de Andalucía, Spain) and the Universidad de Jaén for financial support. JQ and JP thank COLCIENCIAS and UNIVALLE (Universidad del Valle, Colombia) for financial support.

Supplementary data for this paper are available from the IUCr electronic archives (Reference: SK1849). Services for accessing these data are described at the back of the journal.
