In the title compound,  $[\{Co(C_7H_7N_2O_2)_2\} \cdot H_2O]_n$ , the  $Co^{II}$  atom lies on an inversion centre and has octahedral geometry, defined by two O atoms in axial positions and four N atoms in equatorial sites from six different 3,5-diaminobenzoate ligands. Each 3,5-diaminobenzoate anion acts as a  $\mu_3$ -bridging ligand, linking three adjacent  $Co^{II}$  ions through one O atom and two N atoms to form a three-dimensional coordination polymer.

## Comment

In recent years, a large number of metal-organic compounds have been prepared because of the fascinating structural and topological features of these compounds and their potential applications as functional materials, such as catalysts, optical materials and molecule-based magnets (Hagman *et al.*, 1999; Moulton & Zaworotko, 2001; Janiak, 2003). In this field, many organic bridging ligands, such as bipyridine, polyaromatic

carboxylates and their related species, are often selected to coordinate to metal centres to obtain various types of polymeric structures, including one-, two- and three-dimensional network structures (Blake *et al.*, 1999; Eddaoudi *et al.*, 2001;

James, 2003). 3,5-Diaminobenzoic acid, a polydentate organic ligand containing two amino groups and a carboxyl group, can be used as a bridging and/or terminal ligand when it coordinates to various metallic ions. Complexes of this ligand with lanthanide metals, yttrium, molybdenum and tin have been reported (Rzaczynska & Belsky, 1994; Rzaczynska & Sobolev, 1994; Rzaczynska *et al.*, 1994; Udovic *et al.*, 1999; Pruchnik *et al.*, 2002, 2003). However, complexes of the first row transition metals with 3,5-diaminobenzoic acid have not yet been published. In this paper, we report the hydrothermal synthesis and structural characterization of the title complex, (I), which exhibits a three-dimensional network structure through bridging by the 3,5-diaminobenzoate anion.

In complex (I), the repeat unit is composed of one  $Co^{II}$  atom, two 3,5-diaminobenzoate anions and a solvent water molecule. The  $Co^{II}$  atom, lying on an inversion centre, is six-coordinated by four N atoms and two O atoms from six different 3,5-diaminobenzoic acid ligands, forming a slightly distorted octahedral coordination geometry (Fig. 1). The equatorial positions are occupied by the four N atoms. The  $N2^{iv}-Co1-N2^v$  and  $N1^{ii}-Co1-N1^{iii}$  bond angles are both  $180^\circ$ , and the  $N1^{ii}-Co1-N2^{iv}$  and  $N1^{iii}-Co1-N2^{iv}$  bond angles are  $91.05(5)$  and  $88.95(5)^\circ$ , respectively [symmetry codes: (ii)  $x-1, -y+\frac{1}{2}, z-\frac{1}{2}$ ; (iii)  $-x+1, y-\frac{1}{2}, -z+\frac{1}{2}$ ; (iv)  $-x+1, -y, -z$ ; (v)  $x-1, y, z$ ]. The  $Co-N$  bond distances are  $2.2094(13)$  and  $2.2567(13)$  Å (Table 1). The axial positions are occupied by two O atoms, with the  $O1-Co1-O1^i$  bond angle being  $180^\circ$  [symmetry code: (i)  $-x, -y, -z$ ] and the  $Co-O$  bond distances being  $2.0441(11)$  Å. The longer  $Co1 \cdots O2$  distance ( $3.339$  Å) and the larger  $Co1-O1-C1$  angle [ $129.57(11)^\circ$ ] suggest there is no bonding interaction between atoms  $Co1$  and  $O2$ . Thus, the carboxyl group of the

Figure 1

A view of part of the polymeric structure of (I). Displacement ellipsoids are drawn at the 30% probability level. H atoms have been omitted for clarity. Atoms labelled with the suffixes A–E are at the symmetry positions  $(-x, -y, -z)$ ,  $(x-1, -y+\frac{1}{2}, z-\frac{1}{2})$ ,  $(-x+1, y-\frac{1}{2}, -z+\frac{1}{2})$ ,  $(-x+1, -y, -z)$  and  $(x-1, y, z)$ , respectively.

3,5-diaminobenzoate anion coordinates to the Co<sup>II</sup> atom in a monodentate mode (Li *et al.*, 2005).

In complex (I), each 3,5-diaminobenzoate ligand provides two amine N atoms and one carboxylate O atom to coordinate to three Co<sup>II</sup> atoms, thus acting as a  $\mu_3$ -bridging ligand. The bridging of the 3,5-diaminobenzoate anion *via* its O atom and an N atom links the Co<sup>II</sup> atoms into a two-dimensional network in the *bc* plane (Fig. 2). The distance between two adjacent Co<sup>II</sup> atoms in the plane is 9.267 Å, which is comparable with the largest of several Co $\cdots$ Co distances found in [Co(3,4-pyda)(H<sub>2</sub>O)<sub>2</sub>]<sub>n</sub>·H<sub>2</sub>O (9.269 Å; 3,4-pyda is the pyridine-3,4-dicarboxylate dianion; Tong *et al.*, 2004). The large Co $\cdots$ Co distance in (I) indicates the absence of any interaction between the Co<sup>II</sup> atoms. The coordination of another N atom of the 3,5-diaminobenzoate anion (which is not coordinated to a Co<sup>II</sup> atom within the two-dimensional network) to a Co<sup>II</sup> ion of an adjacent two-dimensional network leads to the generation of a three-dimensional network (Fig. 3).

In the extended structure, the uncoordinated carboxylate O atoms, the solvent water molecules and the amino groups of the 3,5-diaminobenzoate ligand are involved in hydrogen bonding. The uncoordinated carboxyl O atoms form hydrogen bonds with the amino groups of the 3,5-diaminobenzoate anion [N2—H2A $\cdots$ O2<sup>iii</sup> = 3.012 (2) Å and N1—H1A $\cdots$ O2<sup>iv</sup> = 2.8357 (19) Å], and the solvent water molecules also form hydrogen bonds with the amino groups of the ligand, as well as with other solvent water molecules [N2—H2B $\cdots$ O3<sup>ii</sup> = 3.165 (8) Å and O3—H3A $\cdots$ O3<sup>i</sup> = 2.977 (16) Å]; the geometry of the hydrogen bonding is given in Table 2. The formation of these hydrogen bonds further stabilizes the three-dimensional structure of the complex.

**Experimental**

A mixture of 3,5-diaminobenzoic acid (0.15 g, 1 mmol), CoCl<sub>2</sub>·6H<sub>2</sub>O (0.12 g, 0.5 mmol), NaOH (0.04 g, 1 mmol) and water (15 ml) in a Teflon-lined stainless steel Parr vessel (25 ml) autoclave was heated at 413 K in an oven for 4 d. The autoclave was then removed from the oven and allowed to cool naturally to room temperature. Brown block-shaped crystals of (I) were obtained in 46% yield. Analysis calculated for C<sub>14</sub>H<sub>16</sub>CoN<sub>4</sub>O<sub>5</sub>: C 44.30, H 4.22, N 14.77%; found: C 44.46, H 4.20, N 14.82%. IR (KBr,  $\nu$ , cm<sup>-1</sup>): 3319 (s), 3265 (m), 1555 (s), 1573 (s), 1387 (vs), 981 (s), 757 (s).
