In the title compound, $\left[\mathrm{Cd}\left(\mathrm{C}_{9} \mathrm{H}_{6} \mathrm{O}_{5}\right)\left(\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{~N}_{2}\right)\left(\mathrm{H}_{2} \mathrm{O}\right)\right]_{n}$, the $\mathrm{Cd}^{\mathrm{II}}$ atom is coordinated in a distorted octahedral fashion by two carboxylate groups (one in a monodentate and one in a bidentate fashion) from two 4-carboxylatophenoxyacetate anions, two N atoms from a $2,2^{\prime}$-bipyridine ligand and one aqua ligand. The structure is a helix with a long pitch of 16.441 (5) $\AA$. A three-dimensional supramolecular network is further constructed through $\pi-\pi$ stacking and hydrogenbonding interactions between the helices.

## Comment

It has been noted that employment of flexible or V-shaped exobidentate organic bridges can improve the helicity of polymeric chains (Ye et al., 2005). Therefore, we assumed that

(I)
the 4-carboxylatophenoxyacetate ( $\mathrm{cpoa}^{2-}$ ) anion, as a multidentate ligand with two different carboxylate groups, one at a flexible site, may be useful in the formation of single-stranded helical chains in the presence of aromatic chelate ligands, such as $2,2^{\prime}$-bipyridine ( $2,2^{\prime}$-bipy) and 1,10 -phenanthroline (phen). These ligands are important in maintaining the one-dimen-
sionality and may provide potential supramolecular recognition sites for $\pi-\pi$ stacking interactions (Chen et al., 2002; Zhang et al., 2004) to form multi-stranded helices. Using 4-carboxyphenoxyacetic acid ( $\mathrm{H}_{2}$ cpoa) and $2,2^{\prime}$-bipy, we have hydrothermally prepared the title compound, $[\mathrm{Cd}($ cpoa)-$\left(2,2^{\prime}\right.$-bipy $\left.)\left(\mathrm{H}_{2} \mathrm{O}\right)\right]_{n}$, (I), which is a new neutral infinite $\mathrm{Cd}^{\mathrm{II}}-$ dicarboxylate helical coordination polymer. The structure is reported in this paper.

The asymmetric unit of (I) contains one $\mathrm{Cd}^{\mathrm{II}}$ atom, one cpoa $^{2-}$ ligand, one $2,2^{\prime}$-bipy ligand and one aqua ligand (Fig. 1). The Cd atom is coordinated by three O atoms from one monodentate and one bidentate carboxylate group of two cpoa ${ }^{2-}$ ligands, the aqua ligand, and two N atoms from the $2,2^{\prime}$-bipy ligand to furnish a distorted octahedral geometry. The $\mathrm{Cd} 1-\mathrm{O} 3^{\mathrm{i}}$ and $\mathrm{Cd} 1-\mathrm{O} 4^{\mathrm{i}}$ bonds are longer than the $\mathrm{Cd} 1-$ O1 bond (see Table 1 for distances and symmetry codes). Each pair of adjacent $\mathrm{Cd}^{\mathrm{II}}$ atoms are bridged by cpoa ${ }^{2-}$ ligands to form a chiral helical chain running along the $2_{1}$ axis in the $c$ direction with a pitch of 16.441 (5) $\AA$; this is longer than the pitch of $11.25(1) \AA$ in $\left[\mathrm{Cu}(\text { ipa })\left(2,2^{\prime}-\text { bipy }\right)\right]_{n} .2 n \mathrm{H}_{2} \mathrm{O}\left(\mathrm{H}_{2} \mathrm{ipa}\right.$ is isophthalic acid; Chen et al., 2002) because the cpoa ${ }^{2-}$ dianion is larger than the ipa ${ }^{2-}$ dianion. These chains are decorated with $2,2^{\prime}$-bipy ligands, positioned alternately on two sides and pointing outwards, as depicted in Fig. 2. The benzene rings of the cpoa ${ }^{2-}$ ions at each side of the helix are arranged in a

parallel fashion, with a vertical inter-ring distance of 5.04 (1) $\AA$; adjacent chiral helices are connected into a twodimensional network through hydrogen bonds involving aqua ligands (Table 2 and Fig. 3). The two-dimensional network is extended into a three-dimensional supramolecular network by $\pi-\pi$ stacking through intercalation of the $2,2^{\prime}$-bipy rings [the face-to-face distance is 3.42 (1) $\AA$; Fig. 4].

## Experimental

$2,2^{\prime}$-Bipyridine ( $0.157 \mathrm{~g}, 1 \mathrm{mmol}$ ) and cadmium nitrate $(0.308 \mathrm{~g}$, 1 mmol ) were dissolved in a hot aqueous solution of 4 -carboxyphenoxyacetic acid $(0.196 \mathrm{~g}, 1 \mathrm{mmol})$ and the pH of the solution was
adjusted to 6 with triethylamine. The solution was sealed in a 15 ml Teflon-lined stainless steel bomb and held at 413 K for 96 h . The bomb was then allowed to cool naturally to room temperature. Colorless prismatic crystals were filtered off, washed with water and dried at room temperature (yield $58 \%$ ).
