In the title compound, $\left[\mathrm{Cd}\left(\mathrm{C}_{2} \mathrm{H}_{8} \mathrm{~N}_{2}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]\left(\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{NO}_{3} \mathrm{~S}\right)_{2} \cdot-$ $2 \mathrm{H}_{2} \mathrm{O}$, the $\mathrm{Cd}^{\mathrm{II}}$ atom, located on an inversion centre, has a distorted octahedral coordination geometry formed by two ethylenediamine and two water molecules. 4-Amino-naphthalene-1-sulfonate acts as a counter-ion to balance the charge, and two antiparallel anions showing strong $\pi-\pi$ stacking interactions are linked by paired $\mathrm{N}-\mathrm{H} \cdots$ O (sulfonate) hydrogen bonds into an isolated $R_{2}^{2}(16)$ dimer. The crystal structure is stabilized by the $\pi-\pi$ stacking interactions and hydrogen bonds.

## Comment

Organosulfonates are widely used industrially as surfactants and dyes. Recently, they have been studied as potential liquid crystalline (Huo et al., 1994) and non-linear optical materials (Marder et al., 1994; Russell et al., 1994), and as complexing agents in the form of sulfonated macrocycles (Steed et al., 1995). However, because of their weak coordination abilities with transition metal ions, most of the reported complexes containing sulfonate are aqua-metal salts in which the sulfonate only acts as a counter-anion to balance the charge (Kosnic et al., 1992; Shubnell et al., 1994; Gunderman et al., 1997). As part of an investigation of the coordination behavior of the sulfonate anion, we present here the crystal structure of the title compound, $\left[\mathrm{Cd}(\mathrm{en})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right](\text { ans })_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$, (I) (en is ethylenediamine and ans is 4 -aminonaphthalene- 1 -sulfonate).

(I)

The crystal structure of (I) consists of $\mathrm{Cd}^{\mathrm{II}}$ complex cations, ans anions and solvent water molecules. The molecular
structure of (I) is shown in Fig. 1. The Cd atom, lying on an inversion center, has a distorted octahedral environment and is coordinated by four N atoms from two diethylenediamine ligands, which lie in the equatorial plane, and by two water O atoms occupying the axial sites. The $\mathrm{Cd}-\mathrm{N}$ distances [average 2.259 (11) $\AA$; Table 1] are slightly shorter than the $\mathrm{Cd}-\mathrm{N}$ distances in $\left[\mathrm{Cd}(\mathrm{en})_{3}\right]\left(\mathrm{NO}_{3}\right)_{2}[\mathrm{Cd}-\mathrm{N}=2.355$ (3)-2.400 (3) $\AA$; Prior, 2006]. The $\mathrm{Cd}-\mathrm{O}$ distance is longer than the equivalent $\mathrm{Cd}-\mathrm{O}$ distances in the complex $\left[\mathrm{Cd}(\mathrm{hmt})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right]-$ $\left[\mathrm{Cd}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right](\mathrm{ans})_{4} \cdot 6 \mathrm{H}_{2} \mathrm{O}[\mathrm{Cd}-\mathrm{O}=2.2804$ (18)-2.3025 (19) $\AA$; hmt is hexamethylenetetramine; Zhou et al., 2005]. The naphthalene ring is essentially planar (the r.m.s. deviation is $0.002 \AA$ ), the greatest deviation from the mean plane being 0.024 (2) $\AA$ for atom C6. The S and N atoms deviate slightly [0.1730 (5) and 0.012 (2) A , respectively] from the naphthalene plane. The centroid-centroid distance between the C3$\mathrm{C} 7 / \mathrm{C} 12$ benzene ring (centroid $C g 1$ ) belonging to the naphthalene ring system in one anion and the C7-C12 benzene ring $(C g 2)$ of the neighboring naphthalene ring system at ( $1-x$, $-y, 1-z$ ) is $3.5384(13) \AA$, and the dihedral angles $\alpha$ (between planes $C g 1$ and $C g 2$ ) and $\beta$ (between the $C g 1-C g 2$ vector and the normal to the $\mathrm{C} 3-\mathrm{C} 7 / \mathrm{C} 12$ ring) are 1.03 and $15.94^{\circ}$, respectively; these values indicate the existence of significant $\pi-\pi$ stacking interactions between adjacent ans ions. Two antiparallel ans anions are linked by paired N $\mathrm{H} \cdots \mathrm{O}$ (sulfonate) hydrogen bonds into an isolated $R_{2}^{2}(16)$ dimer (Bernstein et al., 1995). The formed anionic dimers are packed along the [011] direction with their mean naphthalene

Figure 1

planes perpendicular to those of their neighbors, which is different from the packing mode within the complex $\left[\mathrm{Zn}(\mathrm{en})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right](\mathrm{ans})_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ (Li \& Wang, 2006). Within the latter, four parallel dimers encircle one dimer with a different orientation. The cations and anionic dimers in (I) are linked by intra- and intermolecular hydrogen bonds formed by O atoms from the dimers and H atoms belonging to the en ligands and water molecules, thus forming an infinite onedimensional chain along the [001] direction (Fig. 2). As shown in Fig. 3, a cationic layer is linked to an anionic layer through a series of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}, \mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds. The extensive hydrogen bonds together with the strong $\pi-\pi$ stacking interaction stabilize the crystal structure, forming a three-dimensional network (Table 2).

## Experimental

Ethylenediamine ( $0.06 \mathrm{~g}, 1 \mathrm{mmol}$ ) was added to an aqueous solution $(20 \mathrm{ml})$ of $\mathrm{Cd}(\mathrm{OAc})_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}(0.133 \mathrm{~g}, 0.5 \mathrm{mmol})$. After the mixture had been stirred for 2 h at room temperature, the solution was treated
with sodium 4-aminonaphthalene-1-sulfonate tetrahydrate $(0.32 \mathrm{~g}$, 1 mmol ) in ethanol ( 10 ml ). After filtration, the colorless solution was allowed to stand at room temperature. Colorless block-shaped crystals of the title complex were obtained by slow evaporation of the solvent for about one week.
