The molecular structure of the title compound, $\left[\mathrm{SnBr}_{2^{-}}\right.$ $\left.\left(\mathrm{C}_{9} \mathrm{H}_{12} \mathrm{~N}\right)\left(\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{~N}\right)\right]\left[\mathrm{SnBr}_{4}\left(\mathrm{C}_{9} \mathrm{H}_{12} \mathrm{~N}\right)\right]$, consists of a dibromo-bis[2-(dimethylaminomethyl)phenyl][2-dimethylammoniomethyl)phenyl]tin(IV) cation and a tetrabromo[2-(dimethylaminomethyl)phenyl]tin(IV) anion. As a result of strong intramolecular $\mathrm{N} \rightarrow \mathrm{Sn}$ interactions, distorted trigonal-bipyramidal and octahedral coordination geometries are established for the metal centres of the diorganotin(IV) and monoorganotin(IV) fragments, respectively. The cation and anion are linked together by two $\mathrm{Br} \cdots \mathrm{H}$ contacts, while three additional similar contacts result in a dimeric fragment which repeats in a two-dimensional supramolecular arrangement.

## Comment

During our work on organotin(IV) halides containing the 2-( $\left.\mathrm{Me}_{2} \mathrm{NCH}_{2}\right) \mathrm{C}_{6} \mathrm{H}_{4}$ group (Varga, 2003; Varga et al., 2001, 2005, 2006), we isolated the title compound, (I), in which two ionic organotin(IV) fragments are present (Fig. 1). The structure is similar to that of the chloride derivative (Novak et al., 2006), but for the latter no intra- or intermolecular interactions were discussed.

(I)

The cationic fragment of compound (I) contains an Sn atom with a trigonal-bipyramidal coordination geometry due to the strong intramolecular $\mathrm{N} \rightarrow \mathrm{Sn}$ interaction established by the N atom of the pendant arm from one organic ligand $[\mathrm{Sn} 2-\mathrm{N} 2=$
2.421 (8) $\AA$ A , while the other pendant arm is protonated at the N atom and is twisted away from the Sn centre. The anion has a hexacoordinated Sn atom, with the C atom of the ligand and the N atom from the intramolecularly coordinated $\mathrm{NMe}_{2}$ group $[\mathrm{Sn} 1-\mathrm{N} 1=2.425(6) \AA$ A in cis positions.

Both the ( $\mathrm{C}, \mathrm{N}$ ) $\mathrm{CSnBr}_{2}$ and ( $\mathrm{C}, \mathrm{N}$ ) $\mathrm{SnBr}_{4}$ cores are distorted from ideal geometry as a consequence of the small 'bite' of the pendant arm ligand $\left[\mathrm{C} 10-\mathrm{Sn} 2-\mathrm{N} 2=75.5(3)^{\circ}\right.$ and $\mathrm{C} 1-$ $\left.\operatorname{Sn} 1-\mathrm{N} 1=78.4(3)^{\circ}\right]$. The deviation of the metal atom $(\mathrm{Sn} 2)$ from the equatorial plane ( $\mathrm{C} 10 / \mathrm{C} 19 / \mathrm{Br} 6$ ) is $0.23 \AA$ towards atom Br 5 in the case of the cation, while in the anion, atom C 1 is displaced by $0.55 \AA$ from the best plane determined by atoms $\mathrm{Sn} 1 / \mathrm{Br} 3 / \mathrm{Br} 2 / \mathrm{Br} 4$, towards the pendant arm.

The intramolecular $\mathrm{N} \rightarrow \mathrm{Sn}$ interaction induces planar chirality at the metal centre (Varga et al., 2005, 2006) and the title compound crystallizes as a racemate, i.e. a mixture of $S_{\mathrm{N} 2} R_{\mathrm{N} 1}$ and $R_{\mathrm{N} 2} S_{\mathrm{N} 1}$ isomers.

Figure 1

A view of compound (I), showing the atom-numbering scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level and $H$ atoms are shown as small spheres of arbitrary radii.

Figure 2
The hydrogen bonding (dashed lines) in the crystal structure of compound (I). [Symmetry codes: (i) $-x+1,-y+1,-z$; (ii) $-x+2,-y+1,-z+1$; (iii) $-x+1,-y+1,-z+1$; (iv) $x-1, y$, $z-1$; (v) $x, y, z-1$.]

Figure 3
The supramolecular arrangement of (I). Hydrogen bonds are shown as dashed lines.

The anion and cation of (I) are linked together by a hydrogen-bond contact between one Br atom from the $S_{\mathrm{N} 1}-\left[\left\{2-\left(\mathrm{Me}_{2} \mathrm{NCH}_{2}\right) \mathrm{C}_{6} \mathrm{H}_{4}\right\} \mathrm{SnBr}_{4}\right]^{-}$anion and the H atom from the protonated pendant arm of the $R_{\mathrm{N} 2}-\left[\left\{2-\left(\mathrm{Me}_{2} \mathrm{NCH}_{2}\right) \mathrm{C}_{6} \mathrm{H}_{4}\right\}\{2-\right.$ $\left.\left.\left(\mathrm{Me}_{2} \mathrm{NHCH}_{2}\right) \mathrm{C}_{6} \mathrm{H}_{4}\right\} \mathrm{SnBr}_{2}\right]^{+}$cation $\left[\mathrm{Br} 4 \cdots \mathrm{H} 3 A^{\mathrm{i}}=2.54 \AA\right.$; symmetry code: (i) $1-x,-y,-z$ ]. Also, another hydrogenbond type of interaction is formed between the $R_{\mathrm{N} 2} S_{\mathrm{N} 1}$ and $S_{\mathrm{N} 2} R_{\mathrm{N} 1}$ units $(\mathrm{Br} 4 \cdots \mathrm{H} 26 A=3.116 \AA)$, leading to a dimeric fragment (Fig. 2). This fragment is repeated in a two-dimensional supramolecular arrangement through the weak $\mathrm{Br} \cdots \mathrm{H}$ contacts (range 2.94-3.11 Å) (Fig. 3).

By contrast, a different supramolecular arrangement based on $\mathrm{Cl} \cdots \mathrm{H}$ contacts is observed for the chloride analogue (Novak et al., 2006). On the basis of the CIF file kindly provided by the Cambridge Crystallographic Data Centre, we found that in this case the anion and cation are connected through two $\mathrm{Cl} \cdots \mathrm{H}$ interactions $(\mathrm{Cl} 1 \cdots \mathrm{H} 17 B=2.81 \AA$ and $\mathrm{Cl} 3 \cdots \mathrm{H} 17 \mathrm{C}=2.82 \AA$ ), while three other interactions $\left[\mathrm{Cl} 1 \cdots \mathrm{H} 12^{\mathrm{vi}}=2.78 \AA, \mathrm{Cl} 1 \cdots \mathrm{H} 16 B=2.98 \AA\right.$ and $\mathrm{Cl} 4 \cdots \mathrm{H} 1^{\mathrm{vi}}=$ 2.39 Å; symmetry code: (vi) $-x,-y,-z+1$ ] lead to the formation of a dimeric structure. An interaction between the dimeric units $(\mathrm{Cl} 2 \cdots \mathrm{H} 18 C=2.89 \AA)$ connects them into a polymeric chain.

## Experimental

The title compound was obtained by the reaction between $\left[\left\{2-\left(\mathrm{Me}_{2} \mathrm{NCH}_{2}\right) \mathrm{C}_{6} \mathrm{H}_{4}\right\}\left\{2-\left(\mathrm{Me}_{2} \mathrm{NHCH}_{2}\right) \mathrm{C}_{6} \mathrm{H}_{4}\right\} \mathrm{SnCl}_{2}\right]^{+}\left[\left\{2-\left(\mathrm{Me}_{2} \mathrm{NCH}_{2}\right)-\right.\right.$ $\left.\left.\mathrm{C}_{6} \mathrm{H}_{4}\right\}^{3} \mathrm{SnCl}_{4}\right]^{-}$and excess KBr in a $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{H}_{2} \mathrm{O}$ mixture (1:1). Crystals of (I) suitable for X-ray diffraction were obtained from a solution in a $\mathrm{CH}_{2} \mathrm{Cl}_{2}-n$-hexane (1:4) mixture.

| $\mathrm{C}^{\mathrm{iii}}-\mathrm{H} 26 B \cdots \mathrm{Br}^{\mathrm{iii}}$ | 0.93 | 3.02 | $3.926(12)$ | 166 |

Symmetry codes: (i) $-x+1,-y+1,-z$; (ii) $-x+2,-y+1,-z+1$; (iii) $-x+1$, $-y+1,-z+1$.

All H atoms bonded to C atoms were placed in calculated positions and refined using a riding model, with $\mathrm{C}-\mathrm{H}=0.93-0.97 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C})$ for methyl or $1.2 U_{\text {eq }}(\mathrm{C})$ for aryl H atoms. The methyl groups were allowed to rotate but not to tip. Atom H3A bonded to atom N 3 was refined with an $\mathrm{N}-\mathrm{H}$ DFIX restraint of 0.87 (5) Å.

Data collection: SMART (Bruker, 2000); cell refinement: SMART; data reduction: SAINT-Plus (Bruker, 2000); program(s) used to solve structure: SHELXTL (Bruker, 2001); program(s) used to refine structure: SHELXTL; molecular graphics: ORTEP-3 (Farrugia, 1997) and DIAMOND (Brandenburg \& Putz, 2005); software used to prepare material for publication: publCIF (Westrip, 2006).

The authors thank the National Centre for X-ray Diffraction, Babes-Bolyai University, Cluj-Napoca, Romania, for performing the single-crystal X-ray diffraction study.
