The structure of the title compound, $\left(\mathrm{C}_{7} \mathrm{H}_{10} \mathrm{NO}\right)_{2}\left[\mathrm{Mn}_{2^{-}}\right.$ $\left.\mathrm{V}_{10} \mathrm{O}_{28}\left(\mathrm{H}_{2} \mathrm{O}\right)_{10}\right] \cdot 4 \mathrm{H}_{2} \mathrm{O}$ or $\left(\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{NHCH}_{2} \mathrm{CH}_{2} \mathrm{OH}\right)_{2}\left[\left\{\mathrm{Mn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}\right\}_{2}{ }^{-}\right.$ $\left.\mathrm{V}_{10} \mathrm{O}_{28}\right] \cdot 4 \mathrm{H}_{2} \mathrm{O}$, at $293(2) \mathrm{K}$ has triclinic $(P \overline{1})$ symmetry. The asymmetric unit consists of one half of a decavanadate anion of $C_{i}$ symmetry, one $\left[\mathrm{Mn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}\right]^{2+}$ group, one 2-(2-hydroxyethyl)pyridinium cation and two solvent water molecules. The decavanadate ion bridges between two $\left[\mathrm{Mn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}\right]^{2+}$ groups, thus forming a dodecanuclear complex unit. Complex units are connected via a hydrogen-bonding network, forming supramolecular layers lying in the (001) plane. Cations and solvent water molecules are located between these layers.

## Comment

Over the past few years, the role of vanadium compounds in living organisms has been studied intensively (Rehder, 2008). The biological activitiy of decavanadate, for example in the modulation of ionic channels, calcium homeostasis and insulin mimetics, has been described by Aureliano \& Madeira (1998).

(I)

Decavanadate ions serve as building blocks for supramolecular assemblies (da Silva et al., 2003), but their role as
ligands coordinated to metal centres has only very recently been reported. As donor atoms they can serve as either terminal or bridging O atoms (Fig. 1). In the title compound, (I) (Fig. 2), the bridging doubly monodentate $\left[\mathrm{V}_{10} \mathrm{O}_{28}\right]^{6-}$ anion of $C_{i}$ symmetry (although its symmetry is very close to the $D_{2 h}$ point group) is coordinated via centrosymmetrically arranged 'out-of-the-main-plane' [plane in the $\left[\mathrm{V}_{10} \mathrm{O}_{28}\right]^{6-}$ anion formed by atoms $\mathrm{V} 1, \mathrm{~V} 2, \mathrm{~V} 3, \mathrm{~V} 1^{\mathrm{iv}}, \mathrm{V} 2^{\mathrm{iv}}$ and $\mathrm{V} 3^{\mathrm{iv}}$; symmetry code: (iv) $-x+1,-y+2,-z+1$ ] terminal O1 atoms $(F)$ to the $\left[\mathrm{Mn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}\right]^{2+}$ units, thus completing the octahedral

## Figure 1

The scheme of the decavanadate anion with idealized $D_{2 h}$ point group geometry. $A-G$ denote crystallographically non-equivalent O atoms and circles denote V atoms [according to da Silva et al. (2003)].

Figure 2
The structure of (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level. The symmetry operation relating labelled atoms to unlabelled atoms is $(-x+1,-y+2$, $-z+1$ ).
coordination geometry of the $\mathrm{Mn}^{\mathrm{II}}$ atoms. This is similar to the coordination of $\left[\mathrm{V}_{10} \mathrm{O}_{28}\right]^{6-}$ in $\left[\mathrm{Zn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]\left[\mathrm{Zn}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{10^{-}}\right.$ $\left.\mathrm{V}_{10} \mathrm{O}_{28}\right] \cdot 6 \mathrm{H}_{2} \mathrm{O}$ (Graia et al., 2008). There is also the possibility of coordination via 'in-the-main-plane'-lying terminal O atoms (G) (Klištincová et al., 2008) and 'out-of-the-main-plane'-lying $\mu-\mathrm{OV}_{2}$ bridging O atoms (C) (Li et al., 2007).

The coordination possibilities of the bridging $O$ atoms of the $B, D$ or $E$ type are evidently restricted for steric reasons.

The V5-O1 distance of 1.6350 (11) $\AA$, which corresponds to the bond valence $s=1.59$ (Brown, 1992), is slightly elongated in comparison with other $\mathrm{V}-\mathrm{O}_{t}\left(\mathrm{O}_{t}\right.$ is a terminal O atom) bond lengths which lie in the extremely narrow range 1.5951 (12)-1.5971 (12) $\AA$. This distance is somewhat larger in comparison with those in $\left(\mathrm{NH}_{4}\right)_{2}\left[\mathrm{Cu}_{2}\left(\mathrm{NH}_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{COO}\right)_{4}{ }^{-}\right.$ $\left.\left(\mathrm{V}_{10} \mathrm{O}_{28}\right)\right] \cdot 10 \mathrm{H}_{2} \mathrm{O}(s=1.68)$ (Klištincová et al., 2008) and $\left[\mathrm{Zn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}\right]\left[\mathrm{Zn}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{10} \mathrm{~V}_{10} \mathrm{O}_{28}\right] \cdot 6 \mathrm{H}_{2} \mathrm{O}(s=1.63)$. The averaged bond lengths of the $\mathrm{V}-\mathrm{O}_{b}\left(\mathrm{O}_{b}\right.$ is a bridging O atom $)$ bonds are 1.85 (11), 1.98 (4) and 2.23 (10) $\AA$ for bridging O atoms with coordination numbers two, three and six, respectively.

The $\mathrm{Mn}^{\mathrm{II}}$ atom has an octahedral coordination which is slightly shortened in the axial direction. The equatorial plane of the $\mathrm{MnO}_{6}$ octahedron, given by atoms $\mathrm{Mn} 1, \mathrm{O} 1 M$ and $\mathrm{O} 3 M-\mathrm{O} 5 M$, is nearly parallel with the main plane of the [ $\left.\mathrm{V}_{10} \mathrm{O}_{28}\right]^{6-}$ anion: the corresponding least-squares planes form an angle of $1.83(3)^{\circ}$. The $\mathrm{Mn}-\mathrm{O}$ distances in the equatorial plane are in the range $2.1902(12)-2.2103(12) \AA(s=0.32-$ $0.34)$. The $\mathrm{Mn} 1-\mathrm{O} 1$ distance of $2.1630(11) \AA(s=0.36)$ involves the O atom that links to the decavanadate anion and the shortest distance is the $\mathrm{Mn} 1-\mathrm{O} 2$ bond trans to this $[\mathrm{Mn} 1-\mathrm{O} 2 M=2.1420(13) \AA$, which corresponds to $s=0.39]$.

Figure 3
A view along the $a$ axis of the hydrogen-bonded anionic layers.

Figure 4
A detail of the $R_{4}^{6}(16)$ rings in the anionic chain. [Symmetry codes: (i) $x$, $y-1, z ;$ (ii) $-x+1,-y+1,-z+1$; (iii) $-x+1,-y+2,-z+1$.]

The dodecanuclear $\left[\left\{\mathrm{Mn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}\right\}_{2} \mathrm{~V}_{10} \mathrm{O}_{28}\right]^{2-}$ units are connected via a hydrogen-bonding network (Table 1), forming anionic supramolecular layers lying in the (001) plane (Fig. 3). In these layers, Mn-coordinated water molecules act as hydrogen-bond donors/acceptors and vanadate O atoms act as hydrogen-bond acceptors, forming interesting folded rings with graph set $R_{4}^{6}(16)$ (Etter et al., 1990; Bernstein et al., 1995) (Fig. 4) enforced by $\mathrm{O} 2 M-\mathrm{H} 21 M \cdots \mathrm{O} 7^{7 i}$ and $\mathrm{O} 2 M-$ $\mathrm{H} 22 \mathrm{M} \cdots \mathrm{O} 6^{\mathrm{i}}$ hydrogen bonds [symmetry codes: (i) $-x+2$, $-y+1,-z+1$; (ii) $-x+1,-y+1,-z+1]$. The negative charge of the layers is neutralized by the 2 -(2-hydroxyethyl)pyridinium cations lying between these layers. Cations and solvent water molecules are also involved in the extensive hydrogen-bonding network.
To evaluate the parallel-displaced $\pi-\pi$ interaction between the pyridine rings, neighbouring least-squares planes defined by atoms $\mathrm{C} 1-\mathrm{C} 5 / \mathrm{N} 1$ with symmetry $\operatorname{codes}(x, y, z)$ and ( $2-x$, $1-y, 2-z)$ were calculated. The interplanar distance $R$ is $3.47 \AA$ and the centroid-centroid distance of the aromatic rings $\left(R_{\mathrm{ct}}\right)$ is $4.04 \AA$.

## Experimental

To a solution of $\mathrm{Mn}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2}(0.346 \mathrm{~g}, 2 \mathrm{mmol})$ in water $(20 \mathrm{ml})$, 2-(2-hydroxyethyl)pyridine ( $0.45 \mathrm{ml}, 4 \mathrm{mmol}$ ) was added. The opaque solution was stirred for 15 min and an aqueous solution of $\mathrm{NH}_{4} \mathrm{VO}_{3}$ $(0.468 \mathrm{~g}, 4 \mathrm{mmol}$; in 40 ml of water) was then added with the immediate formation of a precipitate. The solution with the precipitate was stirred for a further 15 min and filtered. The pH of the filtrate was adjusted to 5.0 with dilute HCl ; a yellow solution was obtained, to which ethanol ( 10 ml ) was added. Orange crystals were isolated after standing for 7 d at room temperature. The compound is stable at room temperature. The IR spectrum in KBr pellets was recorded on an FT-IR Nicolet Magna 750 spectrometer. Vanadium was determined by titration with an aqueous solution of $\mathrm{FeSO}_{4} . \mathrm{C}, \mathrm{H}$ and N were estimated on a CHN analyser (Carlo Erba). The IR spectrum exhibits characteristic bands assigned to the organic cation [1640 (m), $1620(m), 1560(m), 1540(m), 1505(m), 1050(m)]$ and the deca-
vanadate group [970 (vs), 827 (s), 725 ( $v s$ ), $590(m)$ ]. Analysis calculated for $\mathrm{C}_{14} \mathrm{H}_{48} \mathrm{Mn}_{2} \mathrm{~N}_{2} \mathrm{O}_{44} \mathrm{~V}_{10}$ (found): C 10.8 (10.6), H 2.6 (3.1), N 1.8 (1.7), V 32.7\% (32.2\%).

Symmetry codes: (i) $-x+2,-y+1,-z+1$; (ii) $-x+1,-y+1,-z+1$; (iii) $x, y-1$,
$z+1$; (iv) $-x+1,-y+2,-z+1$; (v) $-x+2,-y+2,-z+1$.

H atoms of the cations were placed in geometrically idealized positions $(\mathrm{C}-\mathrm{H}=0.93 \AA, \mathrm{~N}-\mathrm{H}=0.86 \AA$ and $\mathrm{O}-\mathrm{H}=0.82 \AA)$ and constrained to ride on their parent atoms $\left[U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C}, \mathrm{N})\right.$ and $\left.1.5 U_{\text {eq }}(\mathrm{O})\right]$. H atoms of the water molecules were located in a difference map and refined with interatomic $\mathrm{O}-\mathrm{H}$ distances restrained to $0.82 \AA$ and $\mathrm{H} \cdots \mathrm{H}$ to $1.324 \AA$ to obtain reasonable geometry (Nardelli, 1999), with $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{O})$.

Data collection: CrysAlisPro (Oxford Diffraction, 2008); cell refinement: CrysAlisPro; data reduction: CrysAlisPro; program(s) used to solve structure: DIRDIF2008 (Beurskens et al., 2008); program(s) used to refine structure: SHELXL97 (Sheldrick, 2008); molecular graphics: DIAMOND (Brandenburg, 2008) and PLATON (Spek, 2003); software used to prepare material for publication: publCIF (Westrip, 2009).

This work was supported by the Ministry of Education of the Slovak Republic (grant No. VEGA 1/4462/07) and Comenius University in Bratislava (grant No. UK/173/2007). The authors also thank the Structural Funds, Interreg IIIA, for financial support in purchasing the diffractometer.

Supplementary data for this paper are available from the IUCr electronic archives (Reference: EG3005). Services for accessing these data are described at the back of the journal.
