The title complex, catena-poly[[[(2,2'-bipyridine- $\left.1 \kappa^{2} N, N^{\prime}\right)$ tris-(methanol- $2 \kappa O$ )(nitrato- $2 \kappa^{2} O, O^{\prime}$ )- $\mu$-cyanido-1:2C: $N$-cyanido$1 \kappa C$-iron(II)neodymium(III)]-di- $\mu$-cyanido-1:2 $\left.C: N ; 2: 1^{\prime} N: C\right]$ methanol solvate], $\left\{\left[\mathrm{Fe}^{\mathrm{II}} \mathrm{Nd}^{\mathrm{III}}(\mathrm{CN})_{4}\left(\mathrm{NO}_{3}\right)\left(\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{~N}_{2}\right)\left(\mathrm{CH}_{3}-\right.\right.\right.$ $\left.\left.\mathrm{OH})_{3}\right] \cdot \mathrm{CH}_{3} \mathrm{OH}\right\}_{n}$, is made up of ladder-like one-dimensional chains oriented along the $c$ axis. Each ladder consists of two strands based on alternating $\mathrm{Fe}^{\mathrm{II}}$ and $\mathrm{Nd}^{\mathrm{III}}$ centers connected by cyanide bridges. Furthermore, two such parallel chains are connected by additional cyanide cross-pieces (the 'rungs' of the ladder), which likewise connect $\mathrm{Fe}^{\mathrm{II}}$ and $\mathrm{Nd}^{\mathrm{III}}$ centers, such that each $\left[\mathrm{Fe}(\mathrm{CN})_{4}(\text { bipy })\right]^{2-}$ unit (bipy is $2,2^{\prime}$-bipyridine) coordinates with three $\mathrm{Nd}^{\mathrm{III}}$ centers and each $\mathrm{Nd}^{\text {III }}$ center connects with three different $\left[\mathrm{Fe}(\mathrm{CN})_{4}(\text { bipy })\right]^{2-}$ units. In the complex, the iron(II) cation is six-coordinated with a distorted octahedral geometry and the neodymium(III) cation is eightcoordinated with a distorted dodecahedral environment.

## Comment

There has been growing interest in the preparation and study of mixed lanthanide-transition metal compounds because lanthanide ions have a rich coordination chemistry with high coordination numbers and significant coordination flexibility, which often leads to unanticipated but remarkable structures (Huang et al., 2008; Zhao et al., 2007; Yeung et al., 2006). A few supramolecular materials have been reported combining hexacyanidometalate ions, $\left[M(\mathrm{CN})_{6}\right]^{3-}(M=\mathrm{Fe}$ and Cr$)$, or octacyanidometalate ions, $\left[M(\mathrm{CN})_{8}\right]^{3-/ 4-}(M=\mathrm{Mo}, \mathrm{W}$ and Nb ), as building blocks with lanthanide ions (Li et al., 2008; Sun et al., 2007; Przychodzen et al., 2007). However, as far as we know, examples of $3 d-4 f$ cyanide-bridged coordination polymers that incorporate diamagnetic $\left[\mathrm{Fe}^{\mathrm{II}}(\mathrm{CN})_{4}(L)\right]^{2-}[L$ is 2,2'-bipyridine (bipy) or 1,10-phenanthroline (phen)] building blocks (Zhao, Wang \& Fang, 2004; Zhao, Wang, Fang \& Chen,
2004) are rare. We report here an interesting one-dimensional ladder-like $3 d-4 f$ cyanide-bridged coordination polymer, (I), based on the $\left[\mathrm{Fe}^{\mathrm{II}}(\mathrm{CN})_{4}(\text { bipy })\right]^{2-}$ building block.

The asymmetric unit in the structure of (I) comprises one $\left[\mathrm{Fe}^{\mathrm{II}}(\mathrm{CN})_{4}(\text { bipy })\right]^{2-}$ anion, one $\left[\mathrm{Nd}^{\mathrm{III}}\left(\mathrm{NO}_{3}\right)\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{3}\right]^{2+}$ cation and one methanol solvent molecule (Fig. 1). Selected geometric parameters are given in Table 1. The crystal structure of (I) consists of one-dimensional ladder-like bimetallic neutral chains, $\left\{\left[\mathrm{Fe}^{\mathrm{II}}(\mathrm{CN})_{4}(\text { bipy })\right]\left[\mathrm{Nd}^{\mathrm{III}}\left(\mathrm{NO}_{3}\right)\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{3}\right]\right\}_{n}$, built up from alternating $\mathrm{Fe}^{\mathrm{II}}$ and $\mathrm{Nd}^{\mathrm{III}}$ metal centers linked through the cyanide bridges (Fig. 2). The ladder-like bimetallic chains contain centrosymmetric $\mathrm{Fe}_{2} \mathrm{Nd}_{2}$ rectangular motifs. The $\left[\mathrm{Fe}(\mathrm{CN})_{4}(\text { bipy })\right]^{2-}$ fragment exhibits a distorted octahedral structure consisting of two N atoms from a planar bipy ligand and four C atoms from four cyanide groups. The small bite angle subtended by the chelating bipy group [80.19 (16) ${ }^{\circ}$ for $\mathrm{N} 1-\mathrm{Fe} 1-\mathrm{N} 2$ ] is one of the main factors accounting for

Figure 1
The molecular structure of (I), showing the atom-numbering scheme. Displacement ellipsoids are drawn at the $30 \%$ probability level and H atoms have been omitted for clarity. [Symmetry codes: (i) $x, y, z-1$; (ii) $-x+1,-y,-z+1$; (iii) $x, y, z+1$.]
this distortion. The bipy $\mathrm{Fe}-\mathrm{N}$ bond distances [2.003 (4) and 1.995 (4) $\AA$ ] are practically the same as those observed in the low-spin iron(II) compound $\mathrm{K}_{2}\left[\mathrm{Fe}^{\mathrm{II}}(\mathrm{CN})_{4}(\right.$ bipy $\left.)\right] \cdot 2.5 \mathrm{H}_{2} \mathrm{O}$ [1.987 (4)-2.003 (4) $\AA$; Nieuwenhuyzen et al., 1998] and in the mononuclear $\left(\mathrm{PPh}_{4}\right)\left[\mathrm{Fe}(\mathrm{CN})_{4}(\right.$ bipy $\left.)\right]$ and the trinuclear $\left[\left\{\mathrm{Fe}^{\mathrm{III}}(\mathrm{CN})_{4}(\text { bipy })\right\}_{2} M^{\mathrm{II}}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}\right] \cdot 4 \mathrm{H}_{2} \mathrm{O}$ species $(M=\mathrm{Mn}$ or Zn ; Lescouezec et al., 2002). Three of the four cyanide groups of the $\left[\mathrm{Fe}(\mathrm{CN})_{4}(\text { bipy })\right]^{2-}$ unit in (I) are bridging, while the fourth is terminal. The $\mathrm{Fe}-\mathrm{C}-\mathrm{N}$ angles for both terminal [176.6 (4) ${ }^{\circ}$ ] and bridging [175.2 (4), 179.0 (5) and $\left.179.4(5)^{\circ}\right]$ cyanide groups deviate slightly from strict linearity. Each $\mathrm{Nd}^{\mathrm{III}}$ cation is eight-coordinated by two O atoms from the $\mathrm{NO}_{3}$ group, three O atoms from three $\mathrm{CH}_{3} \mathrm{OH}$ units and three N atoms from three cyanide ligands, to give a distorted dodecahedral $\mathrm{NdN}_{3} \mathrm{O}_{5}$ coordination environment (Fig. 1). The $\mathrm{Nd}-\mathrm{O}$ bond lengths fall within narrow ranges [2.494 (3)2.542 (3) $\AA$ for nitrate $\mathrm{Nd}-\mathrm{O}$ and 2.462 (3) -2.499 (3) $\AA$ for methanol $\mathrm{Nd}-\mathrm{O}$. The cyanide $\mathrm{Nd}-\mathrm{N}$ bond distances [2.459 (4)-2.509 (4) $\AA$ ] are somewhat shorter than those in $\left\{\left[\mathrm{Ru}(\mathrm{CN})_{4}(\text { phen })\right]_{3}\left[\mathrm{Ln}(\text { terpy })\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}\right]_{2} \cdot n \mathrm{H}_{2} \mathrm{O}\right\}_{\infty}[2.530$ (9)2.548 (11) $\AA$; Baca et al., 2007]. The nitrate ion acts as a

Figure 2
The one-dimensional chain of (I). H atoms have been omitted for clarity. [Symmetry code: (ii) $-x+1,-y,-z+1$.]

Figure 3
A schematic representation of the two-dimensional structure formed via hydrogen bonds (broken lines) between the bimetallic chains of (I). H atoms not involved in hydrogen bonding have been omitted for clarity. [Symmetry codes: (ii) $-x+1,-y,-z+1$; (iv) $x,-y+\frac{1}{2}, z-\frac{1}{2}$.]
bidentate ligand toward $\mathrm{Nd}^{\text {III }}$ through two of its three O atoms, which is different from previously reported lanthanidetransition metal complexes (Yuan et al., 2004; Liu et al., 2008), in which a nitrate ion coordinated to the lanthanide ion acts as a monodenate ligand.

The angles of the cyanide- $\mathrm{Nd}^{\text {III }}$ interactions deviate from linear $\left[\mathrm{Nd} 1{ }^{\mathrm{ii}}-\mathrm{N} 3-\mathrm{C} 11=169.3(4)^{\circ}\right.$, $\mathrm{Nd} 1-\mathrm{N} 6-\mathrm{C} 14=$ $171.1(4)^{\circ}$ and $\mathrm{Nd} 1-\mathrm{N} 5-\mathrm{C} 13=163.2(4)^{\circ}$; symmetry code: (ii) $-x+1,-y,-z+1$; Fig. 2]. The Fe $\cdots \mathrm{Nd}$ separations across cyanide bridges are 5.499 (4), 5.518 (5) and 5.452 (4) $\AA$, in good agreement with those in $\left\{\left[\mathrm{Ru}(\mathrm{CN})_{4}(\text { bipy })\right]_{3}[\mathrm{Ln}(\right.$ terpy $)-$ $\left.\left.\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}\right]_{2} \cdot n \mathrm{H}_{2} \mathrm{O}\right\}_{\infty}$ (Baca et al., 2007). The uncoordinated methanol solvent molecules are involved in hydrogen-bonding interactions with the one terminal cyanide group and a coordinated methanol molecule from another $\left[\mathrm{Nd}^{\mathrm{III}}\left(\mathrm{NO}_{3}\right)\right.$ $\left.\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{3}\right]^{2-}$ unit (Table 2).

Adjacent ladder-like chains are also held together by hydrogen bonds between the terminal cyanide ligands of the $\left[\mathrm{Fe}(\mathrm{CN})_{4}(\text { bipy })\right]^{2-}$ units in one chain and the OH donors of $\mathrm{CH}_{3} \mathrm{OH}$ ligands from $\left[\mathrm{Nd}^{\mathrm{III}}\left(\mathrm{NO}_{3}\right)\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{3}\right.$ ] units in neighboring chains (Table 2). From this arrangement, a twodimensional structure is formed (Fig. 3).

## Experimental

Red-brown prismatic crystals of (I) were obtained by slow diffusion of a methanolic solution of $\mathrm{K}_{2}\left[\mathrm{Fe}(\mathrm{CN})_{4}(\right.$ bipy $\left.)\right] \cdot 3 \mathrm{H}_{2} \mathrm{O}(0.1 \mathrm{mmol})$ and an aqueous solution of $\mathrm{Nd}\left(\mathrm{NO}_{3}\right)_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}(0.1 \mathrm{mmol})$ through a H-tube at room temperature. The resulting crystals were suitable for singlecrystal X-ray diffraction analysis. The product was insoluble in water and methanol.
