The title compound, $C_{23}H_{13}N_5$, derived from cinnamyl alcohol and 2,2'-(isoindolin-1,3-diylidene)bispropanedinitrile, is a heterocyclic TCNQ analogue of interest as an electron-deficient component in charge-transfer complexes. A small perturbation of the four $\text{C}\equiv\text{N}$ angles from linearity is observed, which are in the range 173.41 (18)–176.3 (2) $^\circ$; the $\text{C}\equiv\text{N}$ bond lengths are in the range 1.144 (2)–1.146 (2) \AA . The terminal phenyl group is oriented at an angle of 77.17 (6) $^\circ$ to the C_4N ring and the $\text{C}\equiv\text{C}$ bond is short, 1.319 (2) \AA . There are no classical hydrogen bonds, although intramolecular $\text{C}-\text{H}\cdots\text{N}$ and intermolecular $\text{C}-\text{H}\cdots\pi(\text{arene})$ interactions influence the crystal-structure packing.

Comment

Organic conductors are currently an important research area in materials chemistry (Martin *et al.*, 1997; Yamashita & Tomura, 1998), with special interest in the interaction of π -deficient and π -excessive materials in 1:1 complexes, *e.g.* TCNQ/TTF, where TCNQ is tetracyanoquinodimethane and TTF is tetrathiafulvalene.

The bond lengths and angles in the heterocyclic ring of the title compound, (I) (Fig. 1), are similar to those reported previously in related systems (McNab *et al.*, 1997; Brady *et al.*, 1998; Gallagher & Murphy, 1999; Brady & Gallagher, 2000). For TCNQ (tetracyanoquinodimethane) systems (280 examples), the average exocyclic $\text{Csp}^2=\text{Csp}^2$ and $\text{Csp}^2-\text{Csp}^1$ bond lengths are 1.392 (17) and 1.427 (10) \AA , respectively; thus, in (I), the $\text{C}6\text{A}-\text{C}7\text{A}$, $\text{C}6\text{A}-\text{C}8\text{A}$, and $\text{C}6\text{B}-\text{C}7\text{B}$ and $\text{C}6\text{B}-\text{C}8\text{B}$ bond lengths in the range 1.425 (3)–1.436 (3) \AA are normal (Orpen *et al.*, 1994). The four nitrile $\text{C}\equiv\text{N}$ values are from 1.144 (2) to 1.146 (2) \AA , which compare with the average $\text{C}\equiv\text{N}$ dimension from the literature, 1.144 (8) \AA (Orpen *et al.*, 1994). The exocyclic indolinyl ring $\text{C}\equiv\text{C}$ bond lengths are 1.372 (2) and 1.374 (2) \AA , which are longer than typical double bonds. The four remaining exocyclic indolinyl cyano $\text{C}-\text{C}$ bond lengths are in the range 1.425 (3)–1.436 (3) \AA and similar

**Figure 1**

A view of (I) with the atomic numbering scheme. Displacement ellipsoids are depicted at the 30% probability level.

to previously reported values. The angles which the $\text{C}(\equiv\text{N})_2$ groups make with the C_4N ring are $7.01(10)$ ($\text{C}6\text{A}$) and $2.33(10)^\circ$ ($\text{C}6\text{B}$), demonstrating a small twist from planarity about the $\text{C}4-\text{C}6(\text{A}/\text{B})$ bonds.

The hydrogen bonding in (I) is dominated by intramolecular $\text{C}-\text{H}\cdots\text{N}$ interactions and close contacts (details in Table 2). There are two intramolecular $\text{C}(\text{arene})-\text{H}\cdots\pi(\text{C}\equiv\text{N})$ interactions with $\text{C}12-\text{H}12\cdots\text{N}2\text{A}$ and $\text{C}15-\text{H}15\cdots\text{N}2\text{B}$ $\text{C}\cdots\text{N}$ distances of $3.390(3)$ and $3.390(2)$ \AA , respectively. A $\text{C}1-\text{H}1\text{B}\cdots\text{N}3\text{A}$ intramolecular contact is present [$\text{C}1\cdots\text{N}3\text{A}$ $3.401(2)$ \AA and $\text{C}-\text{H}\cdots\text{N}$ 139°]. A $\text{C}-\text{H}\cdots\pi(\text{arene})$ interaction is also present, $\text{C}14-\text{H}14\cdots\text{Cg}1$, where $\text{Cg}1$ is the centroid of $\{\text{C}21-\text{C}26\}^i$ [symmetry code: (i) $\frac{1}{2}-x, \frac{1}{2}+y, \frac{1}{2}-z$; details in Table 2]. The closest $\text{C}14\cdots\text{C}26$ contact distance is $3.696(2)$ \AA with a $\text{C}14-\text{H}14\cdots\text{Cg}1$ angle of 121° .

Experimental

The title compound was prepared by the 5 d reaction under argon of DIAD (diisopropylazodicarboxylate) (0.37 g, 1.9 mmol), triphenylphosphine (0.49 g, 1.9 mmol), 2,2'-(isoindolin-1,3-diylidene)bisp propane dinitrile (0.25 g, 1.9 mmol) (Farbenfabriken Bayer Aktionsgesellschaft, 1968), cinnamyl alcohol (0.25 g, 1.9 mmol) in 40 ml tetrahydrofuran. 2,2'-(Cinnamylisoindolin-1,3-diylidene)bisp propane dinitrile, (I), was isolated as an orange crystalline material after column chromatography (m.p. 469–471 K uncorrected). IR ($\text{KBr}, \text{cm}^{-1}$): 3049, 2372, 2335, 2224, 1563, 1465, 1407, 1228, 1146, 1109, 983, 775, 723; UV–Vis (CH_3CN) $\lambda_{\text{max}}(\varepsilon)$: 552 (5250), 459 (6667), 414 (3833), 392 (39167), 249 (47083) nm; ^1H NMR (400 MHz, δ , CDCl_3): 8.75 (*m*, 2H, aromatic), 7.85 (*m*, 2H, aromatic), 7.37 (*m*, 2H, aromatic), 7.30 (*m*, 3H, aromatic), 6.50 (*d*, $J = 16$ Hz, 1H), 6.25 (*m*, 1H), 5.50 (*m*, 2H); ^{13}C NMR (δ , CDCl_3): 156.8, 135.0, 134.8, 134.0, 130.9, 128.8, 128.7, 126.9, 126.0, 120.5, 113.1, 112.3, 62.1, 47.8.

Symmetry code: (i) $\frac{1}{2}-x, \frac{1}{2}+y, \frac{1}{2}-z$.

In (I), all H atoms bound to C atoms were treated as riding, with *SHELXL97* (Sheldrick, 1997) defaults for C–H lengths and with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ for methylene H atoms and $1.2U_{\text{eq}}(\text{C})$ for the remainder. Examination of the structure with *PLATON* (Spek, 1998) showed that there were no solvent-accessible voids in the crystal lattice.

Data collection: *XSCANS* (Bruker, 1994); cell refinement: *XSCANS*; data reduction: *XSCANS*; program(s) used to solve structure: *SHELXS97* (Sheldrick, 1997); program(s) used to refine structure: *NRCVAX96* (Gabe *et al.*, 1989) and *SHELXL97* (Sheldrick, 1997); molecular graphics: *ORTEPIII* (Burnett & Johnson, 1996) and *PLATON* (Spek, 1998); software used to prepare material for publication: *NRCVAX96*, *SHELXL97* and *WordPerfect* macro *PREP8* (Ferguson, 1998).

JFG. thanks Dublin City University for the purchase of a Bruker *P4* diffractometer.
