# $W_2Ir_2(\mu_4-\eta^2-C_2Ph_2)(\mu-CO)_4(CO)_4(\eta-C_5H_4Me)_2$

The title compound, octacarbonyl- $\mu$ -diphenylacetylenebis( $\eta^5$ -methylcyclopentadienyl)diiridiumditungsten, W<sub>2</sub>Ir<sub>2</sub>-( $\mu_4$ - $\eta^2$ -C<sub>2</sub>Ph<sub>2</sub>)( $\mu$ -CO)<sub>4</sub>(CO)<sub>4</sub>( $\eta$ -C<sub>5</sub>H<sub>4</sub>Me)<sub>2</sub> or [W<sub>2</sub>Ir<sub>2</sub>(C<sub>6</sub>H<sub>7</sub>)<sub>2</sub>-(C<sub>14</sub>H<sub>10</sub>)(CO)<sub>8</sub>], is a mixed-metal cluster with a butterfly metal core geometry, W atoms at the wing-tip sites and Ir atoms at the hinge positions. A diphenylacetylene ligand is  $\mu_4$ - $\eta^2$ coordinated with the C–C bond parallel to the Ir–Ir vector, completing a pseudo-octahedral W<sub>2</sub>Ir<sub>2</sub>C<sub>2</sub> unit. The W atoms are each ligated by a methylcyclopentadienyl ligand, and the Ir atoms are each ligated by two terminal carbonyls, with the coordination completed by four bridging carbonyls, each of which lies across a W–Ir linkage.

# Comment

The chemistry of the cyclopentadienyl-ligated tetrahedral mixed-metal cluster  $W_2Ir_2(CO)_{10}(\eta^5-C_5H_5)_2$  with alkynes has been examined in order to enhance understanding of how alumina-supported bimetallic W-Ir particles behave; in particular, diphenylacetylene reacts with this ditungstendiiridium cluster to afford  $W_2Ir_2(\mu_4-\eta^2-C_2Ph_2)(CO)_8(\eta-C_5H_5)_2$ (Shapley et al., 1984). We have now investigated the reaction of the methylcyclopentadienyl-ligated cluster analogue  $W_2Ir_2(CO)_{10}(\eta^5-C_5H_4Me)_2$  (Lucas et al., 2001) with diphenylacetylene, and structurally characterized the product, (I). The alkyne formally inserts into the W–W bond of the precursor tetrahedral W<sub>2</sub>Ir<sub>2</sub> cluster to afford a *closo*-octahedral W<sub>2</sub>Ir<sub>2</sub>C<sub>2</sub> cluster. The W<sub>2</sub>Ir<sub>2</sub>C<sub>2</sub> core bond distances in the title complex are essentially identical to those of the phenylacetylenecontaining analogue  $W_2Ir_2(\mu_4-\eta^2-PhC_2H)(\mu-CO)_4(CO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(CO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(CO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(CO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(CO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(CO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(CO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(CO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(CO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(CO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(CO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(DO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(DO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(DO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(DO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(DO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(DO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(DO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(DO)_4(\eta-\eta^2-PhC_2H)(\mu-CO)_4(\eta-\eta-Q)(\mu-CO)_4(\eta-q)(\mu-CO)_4(\mu-CO)_4(\eta-q)(\mu-CO)_4(\eta-q)(\mu-CO)_4(\eta-q)($ C<sub>5</sub>H<sub>5</sub>)<sub>2</sub> (Waterman et al., 1998).

### **Experimental**

Diphenylacetylene (19.5 mg, 0.110 mmol) was added to a red-brown solution of  $W_2Ir_2(CO)_{10}(\eta^5-C_5H_4Me)_2$  (26.6 mg, 0.023 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (20 ml) and the resultant mixture stirred at reflux for 5.5 h. The resulting dark green solution was taken to dryness on a rotary

evaporator, and the residue dissolved in a minimum of CH<sub>2</sub>Cl<sub>2</sub> (*ca* 3 ml) and applied to preparative TLC plates. Elution with CH<sub>2</sub>Cl<sub>2</sub>/ petroleum spirit (3/2) gave two bands. The first band ( $R_{\rm F} = 0.76$ ) was identified as unreacted starting cluster. The contents of the second and major band ( $R_{\rm F} = 0.42$ ) were crystallized from CH<sub>2</sub>Cl<sub>2</sub>/methanol at 276 K to afford dark green crystals identified as W<sub>2</sub>Ir<sub>2</sub>( $\mu_4$ - $\eta^2$ -C<sub>2</sub>Ph<sub>2</sub>)( $\mu$ -CO)<sub>4</sub>(CO)<sub>4</sub>( $\eta$ -C<sub>5</sub>H<sub>4</sub>Me)<sub>2</sub> (20.1 mg, 70%). Analysis calculated for C<sub>34</sub>H<sub>24</sub>Ir<sub>2</sub>O<sub>8</sub>W<sub>2</sub>: C 31.11 H 1.84%. Found: C 30.98 H 1.85%.
