Key indicators

Single-crystal X-ray study
 $T = 173\text{ K}$
Mean $\sigma(\text{C}-\text{C}) = 0.010\text{ \AA}$
Disorder in main residue
 R factor = 0.022
 wR factor = 0.049
Data-to-parameter ratio = 13.2

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

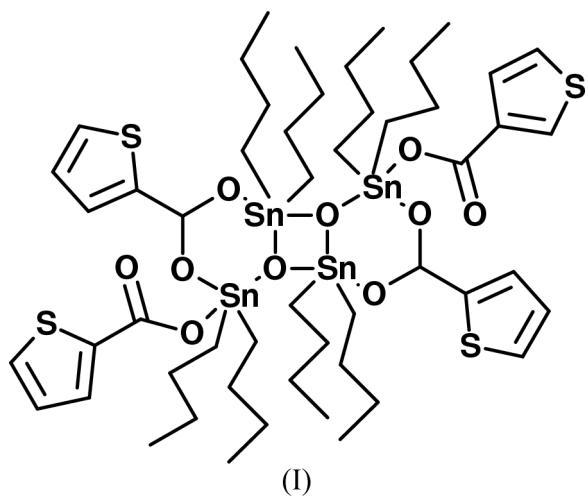

The title compound, octa-*n*-butyl-1 κ^2 C,2 κ^2 C,3 κ^2 C,4 κ^2 C-di- μ_3 -oxo-1:2:3 κ^3 O;2:3:4: κ^3 O-tetrakis(thiophene-2-carboxylate)-1 κ O;1:2 κ^2 O:O';3:4 κ^2 O:O';4 κ O-tetratin(IV), [Sn₄O₂(C₄H₉)₈(C₅H₃O₂S)₄], contains a planar Sn₂O₂ ring. The crystal structure is a racemic twin and shows pseudo-centrosymmetry. A previous structure determination of the title compound [Vatsa *et al.* (1990). *J. Organomet. Chem.* **396**, 9–18] showed the same cell parameters but a centrosymmetric molecule in space group $P2_1/c$.

Comment

The success of cisplatin as an antitumour agent has led to the investigation of antitumour activity in a variety of organotin complexes (Huber *et al.*, 1989; Tiekkink, 1991). Some di-*n*-butyltin complexes have been synthesized and tested; and some of them have been found to be more active *in vitro* than cisplatin (Et-touhami *et al.*, 1991; Gielen, 1994). To continue this investigation, we have recently reported the crystal structure of di-*n*-butylbis(thiophene-2-carboxylato-*O,O'*)tin(IV) (Yahyi *et al.*, 2001).

The crystal structure determination of the title complex, (I), was carried out in order to determine the constitution of the reaction product. Compound (I) contains a planar Sn₂O₂ ring. The other two Sn atoms and the carboxyl groups lie in the plane of this ring. A previous structure determination of (I) (Vatsa *et al.*, 1990) showed the same cell parameters but a centrosymmetric molecule in space group $P2_1/c$. At low temperature, however, we discovered (I) to be a racemic twin showing pseudo-centrosymmetry.

**Figure 1**

A perspective view of the title compound with the atom-numbering scheme. Displacement ellipsoids are at the 30% probability level. H atoms and the minor component of the disordered atoms have been omitted for clarity.

Experimental

The title compound was obtained by refluxing for 6 h equimolar (10 mmol) quantities of thiophene-2-carboxylic acid and dibutyltin oxide in a solution of 200 ml chloroform and 50 ml ethanol. The generated azeotrope was distilled off and evaporated under vacuum. Crystals were obtained by recrystallization from an ethanol solution.

Two thiophene rings are disordered. The resolution of the data did not allow two distinct positions for the S and C atoms to be distinguished. Only one peak was found for each atom in the difference map. Thus, a C and an S atom were refined sharing the same position and the same displacement parameters and just refining the site occupation factor of the respective C and S atoms in order to determine the ratio of the different orientations, which turned out to be 0.760 (7) for C33 and S36, 0.240 (7) for S33 and C36, 0.808 (6) for C43 and S46, and 0.192 (6) for S43 and C46. All H atoms except those of the disordered atoms were located by difference Fourier synthesis and refined with fixed individual displacement parameters [$U(H) = 1.2 U_{\text{eq}}(\text{C})$ or $1.5 U_{\text{eq}}(\text{C}_{\text{methyl}})$] using a riding model with aromatic C—H = 0.95 Å, methyl C—H = 0.98 Å or methylene C—H = 0.99 Å. One butyl group was refined with a disorder model for the three terminal atoms. Distance restraints of 1.52 (1) and 2.52 (1) Å were applied to the 1–2 and 1–3 C—C distances in the disordered group and for the residues C205, C206, C207 and C208. The ratio of the two twin components refined to 0.50 (2). The displacement ellipsoid of C206 is elongated perpendicular to the methylene chain, which might indicate disorder and displays a very short C—C bond.

Data collection: *SMART* (Siemens, 1995); cell refinement: *SMART*; data reduction: *SAINT* (Siemens, 1995); program(s) used to solve structure: *SHELXS97* (Sheldrick, 1990); program(s) used to

refine structure: *SHELXL97* (Sheldrick, 1997); molecular graphics: XP in *SHELXTL-Plus* (Siemens, 1991).
