## Key indicators

Single-crystal X-ray study
$T=298 \mathrm{~K}$
Mean $\sigma(\mathrm{C}-\mathrm{C})=0.006 \AA$
$R$ factor $=0.068$
$w R$ factor $=0.167$
Data-to-parameter ratio $=12.6$
For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

## $r-1, c-2, t-3, t-4-1,3-B i s(4-m e t h o x y p h e n y l)-2,4-b i s(5-$ phenyl-1,3,4-oxadiazol-2-yl)cyclobutane 1,4-dioxane solvate

The asymmetric unit of the crystal structure of $\mathrm{C}_{34} \mathrm{H}_{28} \mathrm{~N}_{4} \mathrm{O}_{4} \cdot \mathrm{C}_{4} \mathrm{H}_{8} \mathrm{O}_{2}$, which is a $1: 1$ inclusion complex, consists of half a molecule of the title compound $t$-DPC and half a molecule of 1,4 -dioxane. The structure shows that $t$-DPC is centrosymmetric; its cyclobutane ring has an exactly planar conformation, and is nearly square. The four $\mathrm{C}-\mathrm{C}$ single bonds are of equal length $[1.569$ (4) $\AA$ ] and the bond angles are $91.6(2)$ and $88.4(2)^{\circ}$. The major photodimerization process is a head-to-tail reaction rather than a head-to-head one.

## Comment

The cyclobutane rings for most tetraarylcyclobutanes have a puckered conformation, such as in $r-1, c-2, t-3, t-4-1,3-b i s[2-(4-$ $R$-phenyl)]-2,4-di-(4-pyridyl)cyclobutane ( $R=\mathrm{Cl}, \mathrm{CH}_{3}, \mathrm{C}_{6} \mathrm{H}_{5}$ ). The average dihedral angles of the cyclobutane ring are 19.2, 24.6 and $16.4^{\circ}$, respectively, in the three structures (Busetti et al., 1980; Zhang et al., 1998; Zhang, Zhang et al., 2000). However, it is very interesting that some tetraoxazolylsubstituted cyclobutanes have planar four-membered rings, as found in $r$-1,c-2,t-3,t-4-tetrakis[2-(5-phenyl-oxazolyl)]cyclobutane (Zhang et al., 1996), r-1,c-2,t-3,t-4-tetrakis[2benzoxazolyl]cyclobutane (Zhang, Li et al., 2000) and $r-1, c-2, t-$ 3,t-4-tetrakis[2-(6,7-dimethylbenzoxazolyl)]cyclobutane (Kao et al., 1989). This interesting phenomenon prompted us to generate a new heteroaryl-substituted cyclobutane in order to study the effect of the substitutent on the conformation of the cyclobutane ring. We report here for the first time that a di-phenyl-diphenyloxadiazolyl-substituted cyclobutane ( $t$-DPC) has a planar conformation.

Figure 1
View of $t$-DPC with $30 \%$ probability ellipsoids.

The X-ray diffraction results clearly show that there are one $t$-DPC molecule and one 1,4-dioxane molecule in the unit cell and the molecules are exactly centrosymmetric, demonstrating that a head-to-tail photodimerization process has occurred. The cyclobutane ring of $t$-DPC is planar, just as in tetraoxazolylcyclobutanes. It appears that the substituents in these compounds, lacking an $\alpha-\mathrm{H}$ atom, have a relatively small steric requirement, allowing a planar four-membered ring.

The two independent pairs of $\mathrm{C}-\mathrm{C}$ bonds of the cyclobutane ring are equal in length $[1.569$ (4) $\AA$ A and are longer than a normal $\mathrm{C}-\mathrm{C}$ single bond. However, this elongation is common for cyclobutanes. The bond angles $\mathrm{C} 8-\mathrm{C} 9-\mathrm{C} 8^{\mathrm{i}}$ and $\mathrm{C} 9-\mathrm{C} 8-\mathrm{C} 9^{\mathrm{i}}$ are 91.6 (2) and 88.4 (2) ${ }^{\circ}$ respectively, so that the cyclobutane ring is almost a square. The dihedral angle between the phenyloxadiazolyl plane and the 4 -methoxyphenyl plane situated on the same side of the cyclobutane ring is $50.4(3)^{\circ}$, intermediate between parallel and perpendicular.

For the five bonds in the oxadiazolyl ring, the $\mathrm{C}-\mathrm{O}$ single bonds are shorter than that $(1.365 \AA$ ) of $2,5-\mathrm{di}(4-$ pyridyl)-$1,3,4$-oxadiazole ( DPO ), but the $\mathrm{N}-\mathrm{N}$ single bond is much longer than that ( $1.409 \AA$ ) of DPO (Stockhause et al., 2001).

The bond angle $\mathrm{C} 1-\mathrm{O} 1-\mathrm{C} 2$ is $118.0(4)^{\circ}$, which is quite large compared with that of common aliphatic ethers, and atoms C 1 and O 1 are almost coplanar with the benzene ring plane [the torsion angles $\mathrm{C} 1-\mathrm{O} 2-\mathrm{C} 2-\mathrm{C} 3$ and $\mathrm{C} 1-\mathrm{O} 2-$ $\mathrm{C} 2-\mathrm{C} 3$ are $-3.1(7)$ and $178.6(4)^{\circ}$, respectively], which means that O 1 is an $s p^{2}$ hybridized atom and there exists an $n$ $\pi$ conjugation between O1 and the benzene ring. Because of the non-bonding repulsion between the methyl group and $\mathrm{H} 3 a$ (on C3), the bond angle $\mathrm{C} 3-\mathrm{C} 2-\mathrm{O} 1$ is increased to $125.0(4)^{\circ}$, whereas the $\mathrm{C} 7-\mathrm{C} 2-\mathrm{O} 1$ angle is reduced to 114.7 (4) ${ }^{\circ}$.

## Experimental

trans-1-(4-Methoxyphenyl)-2-[2-(5-phenyl-1,3,4-oxadiazolyl)]ethene (PDE) was synthesized by condensing 4-methoxybenzaledhyde and 2-methyl-5-phenyl-1,3,4-oxadiazole in DMF with KOH catalysis at 348 K; m.p. $403-404 \mathrm{~K} . \mathrm{UV}$ (1,4-dioxane): $\lambda_{\max } 338$ ( $\log \varepsilon 4.58$ ) nm; IR (KBr): 3056 ( $w$ ), $1640(m), 1606(v s), 1528(v s), 1246(v s), 1176$ (vs), $1012(m), 960(m) \mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right)$ : $\delta 8.14-8.08(4 \mathrm{H}, m), 7.60-$ $7.47(12 \mathrm{H}, m), 6.96-6.89(6 \mathrm{H}, m), 4.10(4 \mathrm{H}, t), 2.00(4 \mathrm{H}, m)$ p.p.m. 1.0 g PDE was dissolved in 200 ml acetonitrile and irradiated with a 300 W medium-pressure mercury lamp for 70 h . Then 200 ml of water was added, the precipitate was filtered and recrystallized from ethanol to give $123 \mathrm{mg} t$-DPC; m.p. $504-505 \mathrm{~K} . \lambda_{\max } 255(\log \varepsilon$ 4.58 ) nm; IR (KBr): 3037 (w), 2958 (w), 1612 ( $s$ ), 1563 ( $s$ ), 1515 ( $v s$ ), $1251(v s), 1181(s), 1037(s), 829(s), 775(s) \mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta$ $7.81(4 \mathrm{H}, d), 7.47(6 \mathrm{H}, m), 7.26(4 \mathrm{H}, d), 6.77(4 \mathrm{H}, d), 4.89(2 \mathrm{H}, t), 4.80$ $(2 \mathrm{H}, t), 3.66(6 \mathrm{H}, s)$ p.p.m. ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 165.65,165.40,159.19$, 131.77, 129.37, 129.11, 128.60, 126.96, 123.97, 114.36, 55.39, 43.70, 39.93 p.p.m. A single-crystal of the title compound was grown in 1,4dioxane by slow evaporation of the solvent.
