## Key indicators

Single-crystal X-ray study
$T=200 \mathrm{~K}$
Mean $\sigma(\mathrm{C}-\mathrm{C})=0.011 \AA$
$R$ factor $=0.038$
$w R$ factor $=0.096$
Data-to-parameter ratio $=20.2$

For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

## Heptacarbonyl( $\alpha$-ethoxybenzylidene) di- $\mu$-diethylphosphidodirhenium

The title compound, $\left[\mathrm{Re}_{2}\left(\mu-\mathrm{PEt}_{2}\right)_{2}(\mathrm{CO})_{7}\{\mathrm{ax}-\mathrm{C}(\mathrm{Ph}) \mathrm{OEt}\}\right]$ or $\left[\mathrm{Re}_{2}\left(\mathrm{C}_{9} \mathrm{H}_{10} \mathrm{O}\right)\left(\mathrm{C}_{4} \mathrm{H}_{10} \mathrm{P}\right)_{2}(\mathrm{CO})_{7}\right]$, contains a carbene ligand with a $Z$ configuration and a non-planar central $\mathrm{Re}_{2} \mathrm{P}_{2}$ ring.

## Comment

The reaction of $\operatorname{Re}_{2}\left(\mu-\mathrm{P} R_{2}\right)_{2}(\mathrm{CO})_{8}$ with nucleophilic lithium organyls $\mathrm{Li} R^{\prime}$ leads to the salts $\mathrm{Li}\left(\operatorname{Re}_{2}\left(\mu-\mathrm{P} R_{2}\right)_{2}(\mathrm{CO})_{7}\{\right.$ ax$\left.\mathrm{C}\left(R^{\prime}\right) \mathrm{O}\right\}$ which then can be converted to Fischer-type carbene complexes (Haupt et al., 1998a). The title compound, (I), with $R=$ ethyl and $R^{\prime}=$ phenyl, is an axial monocarbene complex with a $\mathrm{Re}_{2} \mathrm{P}_{2}$ ring and slightly distorted octahedral coordination at both Re atoms. The $\mathrm{C}(\mathrm{Ph}) \mathrm{OEt}$ carbene group with a $Z$ configuration is axially attached to Re 2 with a $\mathrm{Re}=\mathrm{C}$ doublebond length of 2.098 (7) A. The orientation of the ReCOEt group is parallel to the $\mathrm{Re} \cdots \mathrm{Re}$ vector with a $\mathrm{Re} \cdots \mathrm{Re}-\mathrm{C} 8-$ O8 torsion angle of $-3.2(6)^{\circ}$. The Re1-P bonds of 2.5154 (17) and 2.5122 (19) $\AA$ for P1 and P2, respectively, are slightly longer than those for $\mathrm{Re} 2-\mathrm{P}$ of 2.5024 (18) and 2.5023 (17) $\AA$, and reflect the unsymmetrical monosubstitution of this compound. These distances are, on average, slightly shorter than the $\mathrm{Re}-\mathrm{P}$ bonds of the related monoand dicarbene complexes which have $\mu$ - $\mathrm{PPh}_{2}$-bridging ligands instead (Haupt et al., 1998a). The average values for the enclosed ring angles are $\mathrm{Re}-\mathrm{P}-\mathrm{Re}=104.35$ (6) ${ }^{\circ}$ and $\mathrm{P}-$ $\mathrm{Re}-\mathrm{P}=75.43(6)^{\circ}$. The $\mathrm{Re}_{2} \mathrm{P}_{2}$ ring is folded, with an $\mathrm{ReP}_{2} /$ $\mathrm{P}_{2}$ Re dihedral angle of $6.2(1)^{\circ}$. This is a well known effect due to an intramolecular balance of unsymmetrical or sterically unfavourable substituted carbonyl complexes of this type (Haupt et al., 1998a,b; Flörke \& Petters, 2001). The C-Re-$\mathrm{Re}-\mathrm{C}$ torsion angles range from 0.2 (4) to 8.8 (4) ${ }^{\circ}$ (absolute values), in accordance with the ecliptic carbonyl-ligand arrangements.

(I)

## Experimental

The title compound was obtained by reaction of $\mathrm{Li}\left(\operatorname{Re}_{2}(\mu-\right.$ $\left.\left.\mathrm{PEt}_{2}\right)_{2}(\mathrm{CO})_{7}[\mathrm{C}(\mathrm{Ph}) \mathrm{O})\right\}$ with $\mathrm{OEt}_{3} \mathrm{BF}_{4}$ in $\mathrm{CHCl}_{3}$ solution at room temperature. The synthesis of the precursor Li salt has been described earlier (Haupt et al., 1998a).
