# 3-Pyridylmethylphosphonic acid monohydrate 

The title molecule, $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{NO}_{3} \mathrm{P} \cdot \mathrm{H}_{2} \mathrm{O}$, has a zwitterionic structure. The crystal-packing properties are influenced by the presence of water molecules in the crystal lattice and are stabilized by stacking interactions between pyridyl rings. Hydrogen bonds link the molecules in a three-dimensional network.

## Comment

The investigation presented in this paper is part of systematic studies of organophosphorus derivatives of pyridine. Here we describe the crystal structure of 3-pyridylmethylphosphonic acid monohydrate, (I). In previous papers, the structures of 2-pyridylmethylphosphonic acid, (II) (Gałdecki \& Wolf, 1990), and 4-pyridylmethylphosphonic acid monohydrate, (III) (Wolf et al., 1996), were reported. Knowledge of the structure of these compounds will help to design and synthesize new platinum(II) complexes with cytotoxic activity using them as ligands. Platinum(II) complexes of phosphonate ligands exhibit significant antitumour activity (Klenner et al., 1993; Bloemink et al., 1994).

(I)

The title molecule exists as a zwitterion. Negative charge is spread over the $\mathrm{O} 2-\mathrm{P} 1-\mathrm{O} 3$ fragment of the phosphonic group while the positive charge, formally located on the N atom, is delocalized over the pyridyl ring.

The most interesting feature of (I) is the significant difference between the $\mathrm{P} 1-\mathrm{O} 2$ and $\mathrm{P} 1-\mathrm{O} 3$ bond lengths, as large as $10 \sigma$, while the corresponding values in the previous reported structures, (II) and (III), are not significantly different, 1.500 (4) and 1.507 (3) $\AA$, and 1.506 (2) and 1.5039 (14) $\AA$, respectively. However, the above-mentioned values for bond distances $\mathrm{P} 1-\mathrm{O} 2$ and $\mathrm{P} 1-\mathrm{O} 3$ in (I) are within the range for delocalized bond lengths $1.473-1.534 \AA$ (mean value $1.501 \AA$ ) in aminophosphonic acids (Choi \& McPartlin, 2000).

Figure 1
The structure of the title compound with the atom-labelling scheme. Displacement ellipsoids are drawn at the $40 \%$ probability level.

Analysis of the structural data indicates that the coordination around the P atom is nearly tetrahedral, with the angles varying from 105.03 (10) to 116.84 (11) ${ }^{\circ}$.

Table 2 presents the hydrogen-bonding geometry and $\mathrm{C}-$ $\mathrm{H} \cdots \mathrm{O}$ interactions, with $\mathrm{H} \cdots \mathrm{O}$ contacts significantly less than the sum of the van der Waals radii (Taylor \& Kennard, 1982).

The crystal-packing properties are influenced by the presence of water molecules in the crystal lattice. The solvent water molecule is a donor of two hydrogen bonds and is involved in two $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions.

Considering the above $\mathrm{P}-\mathrm{O}$ distances, it should be noticed that they correspond to three different environments (in order of decreasing bond distances): O 1 is protonated and a donor in one $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ interaction; O 2 is an acceptor in two $(\mathrm{O}-$ $\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ ) interactions; O 3 is an acceptor in three (two $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and one $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ ) interactions.

Apart from the typical hydrogen bonds, aromatic $\pi-\pi$ stacking interactions between pyridyl rings are found. They additionally stabilize the molecular packing of (I). The distances between the centroids of the pyridyl rings are $\mathrm{Cg} 1 \cdots \mathrm{Cg} 2(1-x, 1-y, 1-z)=3.738(4) \AA$ and $\mathrm{Cg} 1 \cdots \mathrm{Cg} 3(-x$, $1-y, 1-z)=4.021(4) \AA$. The perpendicular distances between the rings are 3.514 (4) and 3.459 (4) $\AA$, respectively.

The conformation of the non-H skeleton of the title molecule is described by the torsion angles summarized in Table 1.

## Experimental

The title compound was synthesized in one step by the acidolysis of diethyl 3-pyridylmethylphosphonate with hydrobromic acid in acetic acid (Wasilewski et al., 1976; Ochocki et al., 1997) and was recrystallized from a water/ethanol mixture ( $1: 1$ by volume). The purity of the product was confirmed by ${ }^{1} \mathrm{H}$ NMR analysis.

Symmetry codes: (i) $x-\frac{1}{2}, \frac{1}{2}-y, z-\frac{1}{2}$; (ii) $\frac{1}{2}-x, \frac{1}{2}+y, \frac{3}{2}-z$; (iii) $-x, 1-y, 2-z$; (iv) $1-x, 1-y, 2-z ;(\mathrm{v})-x, 1-y, 1-z$.

H atoms of the pyridyl and methylene groups, except H1, were geometrically placed and refined using a riding model with isotropic displacement parameters equal to $1.2 U_{\text {eq }}$ of the attached C atom. H atoms involved in hydrogen bonds were located from a difference map and refined isotropically. Atoms H401 and H402 of the solvent
water molecule were refined with the $\mathrm{O}-\mathrm{H}$ distances restrained to 0.95 (3) $\AA\left(U_{\text {iso }}=1.5 U_{\text {eq }}\right.$ of atom O4).

Data collection: KM-4 Data Collection Program (Kuma, 1998); cell refinement: KM-4 Data Collection Program; data reduction: DATAPROC (Kuma, 1996); program(s) used to solve structure: SHELXS86 (Sheldrick, 1990); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: ORTEX (McArdle, 1995); software used to prepare material for publication: PARST97 (Nardelli, 1996b).
