# [Hydroxy(4-pyridyl)methyl]phosphonic acid monohydrate 

The title compound, $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{4} \mathrm{NP} \cdot \mathrm{H}_{2} \mathrm{O}$, contains one phosphonate group and one pyridyl ring connected by a $\mathrm{CH}(\mathrm{OH})$ group. The pyridyl N atom and one of the three phosphonate O atoms are protonated. Extensive hydrogen-bonding interactions, as well as $\pi-\pi$-stacking interactions, are found between the molecules, thus generating a three-dimensional supramolecular network structure.

## Comment

Metal phosphonates are organic-inorganic hybrid materials that can be designed to possess specific properties; these include ion exchangers, sensors, non-linear optical materials and catalysts (Clearfield, 1998). A number of functional phosphonic acids have been employed to build up novel structures, ranging from one-dimensional chains, through twodimensional layers to three-dimensional pillared layers or open frameworks. As a potential multidentate ligand, [hydroxy(4-pyridyl)methyl]phosphonic acid is capable of forming extended structures with metal ions. During our efforts to synthesize a cobalt compound by direct reaction of the acid with $\mathrm{CoCl}_{2}$ under hydrothermal conditions, however, good quality single crystals of the unreacted acid were obtained as the monohydrate, (I).

(I)

Fig. 1 shows that the phosphonate group and the pyridyl ring are separated by a $\mathrm{CH}(\mathrm{OH})$ group. Consequently, a chiral center is created at atom C6. Among the three phosphonate O atoms, only O 3 is protonated; hence the $\mathrm{P}-\mathrm{O} 3$ distance is 1.5736 (19) $\AA$, much longer than the other two $\mathrm{P}-\mathrm{O}$ distances (Table 1). The $\mathrm{P}-\mathrm{C}$ and $\mathrm{C}-\mathrm{O}$ distances are normal. The $\mathrm{CPO}_{3}$ tetrahedron is slightly distorted, with the $\mathrm{O}-\mathrm{P}-\mathrm{O}(\mathrm{C})$ angles ranging from 105.61 (12) to 117.98 (11) ${ }^{\circ}$. The pyridyl N atom is also protonated in order to balance the overall charge. The neighboring molecules are connected by the hydrogen bonds between the phosphonate O atoms and the hydroxyl O atom, forming an infinite chain along the $2_{1}$ screw axis (Table 2). These chains are held together through hydrogen bonds between $\mathrm{O} 1 W$ and the phosphonate O atoms (O1 and O 2 ), forming a chiral layer. $\pi-\pi$-Stacking interactions are also found within the layer, with a centroid-to-centroid distance of 3.61 (2) $\AA$ for adjacent pyridyl rings. Neighboring layers are

The molecular structure of (I), shown with $50 \%$ probability displacement ellipsoids.
situated about inversion centers and are linked by hydrogen bonds between atoms $\mathrm{O} 1 W$ and N 1 , thus leading to a racemic three-dimensional supramolecular network (Fig. 2).

## Experimental

Colorless single crystals of (I) were obtained by hydrothermal treatment of a mixture of [hydroxy(4-pyridyl)methyl]phosphonic acid $(0.0986 \mathrm{~g}, \quad 0.5 \mathrm{mmol} ; \quad$ Bogdan, 1996$), \quad \mathrm{CoCl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O} \quad(0.0623 \mathrm{~g}$, 0.25 mmol ) and $8 \mathrm{ml} \mathrm{H} \mathrm{H}_{2} \mathrm{O}-\mathrm{EtOH}$ (1:3) at 413 K for 2 d , then cooling slowly to room temperature.

Symmetry codes: (i) $\frac{1}{2}+x, \frac{3}{2}-y, \frac{1}{2}+z$; (ii) $x-\frac{1}{2}, \frac{3}{2}-y, z-\frac{1}{2}$; (iii) $\frac{1}{2}-x, y-\frac{1}{2}, \frac{3}{2}-z$; (iv) $\frac{3}{2}-x, y-\frac{1}{2}, \frac{3}{2}-z$.

The positions of all H atoms of the pyridyl ring, except for that on N , were fixed geometrically and distances to H atoms were set by the refinement program ( $\mathrm{C}-\mathrm{H}=0.93-0.98 \AA$ ). The other H atoms were found from difference density maps. The bond distances were $\mathrm{O}-\mathrm{H}$ $=0.77$ (3) -0.95 (3) $\AA$ and $\mathrm{N}-\mathrm{H}=0.93$ (3) $\AA$.

Data collection: SMART (Bruker, 1997); cell refinement: SMART; data reduction: SAINT (Bruker, 1997); program(s) used to solve structure: SHELXTL (Bruker, 1997); program(s) used to refine structure: SHELXTL; molecular graphics: SHELXTL; software used to prepare material for publication: SHELXTL.
