## Key indicators

Single-crystal X-ray study
$T=296 \mathrm{~K}$
Mean $\sigma(\mathrm{O}-\mathrm{C})=0.005 \AA$
$R$ factor $=0.033$
$w R$ factor $=0.022$
Data-to-parameter ratio $=14.1$

For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

## Tris(O-methyldithiocarbonato)chromium(III)

In the title complex, $\left[\mathrm{Cr}\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{OS}_{2}\right)_{3}\right]$, the Cr atom is coordinated by six S atoms in a distorted octahedral arrangement. The six $\mathrm{Cr}-\mathrm{S}$ bond distances are in the range 2.391 (1)-2.406 (1) Å, with an average of 2.397 (2) $\AA$.

## Comment

As part of a study of metal xanthates and dialkyl dithiophosphates (Ito, 2002a,b), the crystal and molecular structure of the title complex, (I), has been determined. A displacement ellipsoid plot of (I) is shown in Fig. 1. The average $\mathrm{Cr}-\mathrm{S}$ distance of 2.397 (2) $\AA$ is 0.032 (7) $\AA$ shorter than that in $\operatorname{tris}\left(O, O^{\prime}\right.$-dimethyldithiophosphato)chromium(III), (II) (Ito, 2002b), which shows that the $\mathrm{Cr}-\mathrm{S}$ bonds in (I) are stronger than those in (II). On the other hand, distortions of S atoms around the Cr atom from octahedral coordination in (I) are larger than those in (II). For example, average $\mathrm{S}-\mathrm{Cr}-\mathrm{S}$ chelate angles in (I) and (II) are $74.5(2)^{\circ}$ and $81.8^{\circ}$, respectively.

The structures of xanthate ligands in (I) are very similar to those in iron methylxanthate, (III) (Ito, 2002a). Average S-C, $\mathrm{S}_{2} \mathrm{C}-\mathrm{O}$ and $\mathrm{O}-\mathrm{CH}_{3}$ bond distances of 1.688 (4), 1.318 (4) and 1.446 (4) A , respectively, are in agreement with the corresponding distances in (III), within standard uncertainties.

## Experimental

Potassium methylxanthate ( 2.0 g ) and hexaaquachromium(III) chloride ( 4.0 g ) were each dissolved in pure water ( 40 ml and 80 ml , respectively), and a powder of (I) was precipitated by combining the two solutions. Recrystallization from an ether solution at room temperature gave dark-blue plate-shaped crystals of (I).

## Crystal data

$\left[\mathrm{Cr}\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{OS}_{2}\right)_{3}\right]$
$M_{r}=373.55$
Monoclinic, $P 2_{1} / n$
$a=9.633$ (4) $\AA$ 。
$b=13.852$ (4) $\AA$
$c=11.301$ (3) A
$\beta=106.94$ (2) ${ }^{\circ}$
$V=1442.5(8) \AA^{3}$
$Z=4$
$D_{x}=1.720 \mathrm{Mg} \mathrm{m}^{-3}$
$D_{m}=1.715 \mathrm{Mg} \mathrm{m}^{-3}$
$D_{m}$ measured by flotation in zinc iodide (aq.)
Mo $\mathrm{K} \alpha$ radiation
Cell parameters from 23 reflections
$\theta=15.2-16.3^{\circ}$
$\mu=1.65 \mathrm{~mm}^{-1}$
$T=296 \mathrm{~K}$
Plate, dark blue
$0.45 \times 0.35 \times 0.10 \mathrm{~mm}$

## Data collection

Rigaku AFC- $5 S$ diffractometer
$\omega-2 \theta$ scans
Absorption correction: $\psi$ scan (North et al., 1968)
$T_{\text {min }}=0.510, T_{\text {max }}=0.848$
3640 measured reflections
3311 independent reflections 2041 reflections with $I>3 \sigma(I)$

$$
\begin{aligned}
& R_{\text {int }}=0.029 \\
& \theta_{\max }=27.5^{\circ} \\
& h=0 \rightarrow 12 \\
& k=0 \rightarrow 17 \\
& l=-14 \rightarrow 14 \\
& 3 \text { standard reflections } \\
& \quad \text { every } 150 \text { reflections } \\
& \text { intensity decay: } 0.1 \%
\end{aligned}
$$

## Refinement

Refinement on $F$
H -atom parameters constrained
$R=0.033$
$w R=0.022$
$w=1 / \sigma^{2}\left(F_{o}\right)$
$(\Delta / \sigma)_{\max }<0.001$
$\Delta \rho_{\text {max }}=0.26 \mathrm{e}^{-3}{ }^{-3}$
$\Delta \rho_{\text {min }}=-0.29 \mathrm{e}^{-3}$
2041 reflections
145 parameters

## Table 1

Selected geometric parameters $\left(\AA^{\circ},{ }^{\circ}\right)$.
