In the title compound, $\text{C}_7\text{H}_7\text{N}_2^+ \cdot \text{C}_7\text{H}_3\text{ClNO}_4^-$, the cations and anions are connected by $\text{N}-\text{H} \cdots \text{O}$ hydrogen bonds to afford a 2_1 helical chain.

Comment

The title compound, (I), was investigated as part of a study on $D-\text{H} \cdots A$ hydrogen bonding ($D = \text{N}, \text{O}$ or C ; $A = \text{N}, \text{O}$ or Cl) in chloro- and nitro-substituted benzoic acid-amine systems (Ishida *et al.*, 2001*a,b,c,d,e*). In the crystal, the cations and anions are held together by $\text{N}-\text{H} \cdots \text{O}$ hydrogen bonds (Table 2) and a weak $\text{C}-\text{H} \cdots \pi$ interaction [$\text{H}10 \cdots \text{Cg}$ 2.93 (3) \AA , $\text{C}13 \cdots \text{Cg}$ 3.679 (3) \AA , $\text{C}13-\text{H}10 \cdots \text{Cg}$ 143.5 (19) $^\circ$, where Cg denotes the centroid of the benzene ring $\text{C}1-\text{C}6$] (Fig. 1) to afford a 2_1 helical chain running along the b axis (Fig. 2). A similar helical chain is observed in imidazolium 2-chloro-4-nitrobenzoate, giving a chiral crystal (Ishida *et al.*, 2001*e*). The present salt, however, crystallizes in the centrosymmetric space group $C2/c$. Neighboring helical chains related by an inversion center are connected through $\text{C}-\text{H} \cdots \text{O}$ hydrogen bond (Fig. 2, Table 2), and those related by a twofold rotation axis are linked by a $\pi-\pi$ stacking interaction between the aromatic rings $\text{C}9-\text{C}14$ of the benzimidazolium ion. The dihedral angle between the aromatic rings is 1.35 (11) $^\circ$, and their interplanar separation and the centroid offset are 3.480 (2) and 0.769 (2) \AA , respectively. The carboxyl group is twisted considerably out of the plane of the benzene ring, probably because of the strong $\text{N}-\text{H} \cdots \text{O}$ hydrogen bonds; the dihedral angle between them is 67.15 (13) $^\circ$. This may cause a close contact of $\text{O}1 \cdots \text{N}1^{\text{iii}}$, 2.832 (3) \AA [symmetry code: (iii) $1-x, 1-y, -z$], between two chains running in antiparallel directions. The $\text{N} \cdots \text{O}$ distance [2.610 (3) \AA] in the $\text{N}2-\text{H}4 \cdots \text{O}2$ hydrogen bond is significantly shorter than the average $\text{N} \cdots \text{O}$ distance of 2.878 (3) \AA for an $\text{N}-\text{H} \cdots \text{O}=\text{C}$ hydrogen bond (Taylor *et al.*, 1984).

Experimental

Crystals of (I) were obtained by slow evaporation from an acetonitrile solution of benzimidazole and 2-chloro-4-nitrobenzoic acid in a molar ratio of 1:1.
