## $N, N, N^{\prime}, N^{\prime}$-Tetrakis(2-pyridiniomethyl)ethylenediamine tetraperchlorate

#### Abstract

The title compound, $\left(\mathrm{HpyCH}_{2}\right)_{2} \mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{~N}\left(\mathrm{CH}_{2} \mathrm{PyH}\right)_{2}{ }^{-}$ $\left(\mathrm{ClO}_{4}\right)_{4}$ or $\mathrm{C}_{26} \mathrm{H}_{32} \mathrm{~N}_{6}{ }^{4+} \cdot 4 \mathrm{ClO}_{4}^{-}$, is a salt of a centrosymmetric tetraprotonated tetrapyridine. As in many related compounds, the pyridyl N atoms are protonated while the tertiary amine N atoms are not.

## Comment

During an attempted alternate synthesis of $N, N$-bis(2pyridylmethyl)ethylenediamine (Matouzenko et al., 1997), by the reaction of two equivalents of 2-picolyl chloride with one equivalent of ethylenediamine, the title compound, (I), was obtained.

The compound spans a center of symmetry and contains four perchlorate ions and a tetracation with only the pyridine N atoms protonated; the tertiary amine N atoms are not protonated. While this would seem to be unexpected (Gomes et al., 2000; Kim et al., 1995), based on the $\mathrm{pK}_{a}$ values of pyridine and triethylamine ( 5.2 and 11.0 , respectively), the picolyl groups apparently have a profound inductive effect on the tertiary amine N atom, making it much less basic. The protonation constants of $N, N, N^{\prime}, N^{\prime}$-tetrakis(2-pyridylmethyl)ethylenediamine (TPEN) were first reported (and the compound synthesized) in 1967 (Anderegg \& Wenk, 1967). In that same article, the synthesis and protonation constants of a similar compound, tris(2-pyridylmethyl)amine (TPA), were also reported. The sites of protonation (the pyridine N atoms and not the tertiary amine N atoms) for TPEN and TPA were reported in 1977 (Anderegg et al., 1977) and subsequently confirmed by ${ }^{15} \mathrm{~N}$ NMR for TPA (Anderegg et al., 1986). The structure of protonated TPA was first reported in 1991 (Britton et al., 1991) and again in 1999 (Hazell et al., 1999), with the pyridine N atom protonated.

Protonation of the pyridine N atoms in (I) results in a ring angle at nitrogen of about $123^{\circ}$ [123.0 (2) and 123.1 (2) ${ }^{\circ}$ at N2 and N3, respectively]. Similar angles are observed for other protonated pyridines (Britton et al., 1991; Kim et al., 1995; Hazell et al., 1999; Gomes et al., 2000), while neutral noncoordinated pyridines have smaller ring angles (for example, $119.6^{\circ}$ in a pyridine macrocycle; Kim et al., 1995). The pyridinium groups hydrogen bond to O3 [the $\mathrm{N} 2 \cdots \mathrm{O} 3$ and

Figure 1
Perspective drawing of the title compound, with ellipsoids at the $50 \%$ probability level.

N3..O3 separations are 2.917 (3) and 2.847 (3) $\AA$, respectively]. The metrical parameters of the perchlorate ions are unremarkable.

## Experimental

2-Picolyl chloride hydrochloride ( $60.96 \mathrm{mmol}, 10.00 \mathrm{~g}$ ) was added, with cooling, to 26.67 ml of deionized water in a 500 ml three-neck round-bottomed flask equipped with a separatory funnel. Aqueous NaOH ( $61 \mathrm{mmol}, 11.3 \mathrm{ml}$ of a 5.4 M solution) was added dropwise, producing a light-red emulsion. Ethylenediamine ( 30.48 mmol , $1.832 \mathrm{~g}, 2.038 \mathrm{ml}$ ) was slowly added dropwise through the separatory funnel. The resultant mixture was stirred for 5 h at ambient temperature. Two layers were observed. The top layer was carefully removed. Perchloric acid ( $70 \mathrm{wt} \%$ ) was added dropwise to the remaining red-brown layer until the pH was approximately 3 , resulting in crystallization. Recrystallization from deionized water gave brown crystals $(2.96 \mathrm{~g}, 3.58 \mathrm{mmol})$.
