## $N$-(3-Methoxypropyl)-1,8-naphthalimide

In the title compound, $\mathrm{C}_{16} \mathrm{H}_{15} \mathrm{NO}_{3}$, the 1,8 -naphthalenodicarboximide group is nearly planar and, in the naphthalimide ring system, the characteristic alternating pattern of bond lengths is observed. In the crystal, the molecules are connected by a weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond and extend in the direction parallel to the $b$ axis.

## Comment

$N$-Substituted 1,8-naphthalimide derivatives have fluorescence properties, which are interesting in view of their use as laser active media (Pardo et al., 1987), and they are excellent fluorescent cell markers (Stewert, 1981; Marling et al., 1974). Substituent effects on the photophysical properties of these compounds have been investigated widely (Demeter et al., 1994). With the aim of studying the relationship between the molecular structure and the photophysical properties of $N$-substituted 1,8 -naphthalimide derivatives, the crystal structure of $N$-(3-methoxypropyl)-1,8-naphthalimide, (I), was investigated.

(I)

In (I), the 1,8-naphthalenodicarboximide group is nearly planar. The torsion angles which most significantly deviate from $0^{\circ}$ are $\mathrm{C} 8-\mathrm{C} 11-\mathrm{N} 1-\mathrm{C} 12\left[5.3(2)^{\circ}\right]$ and $\mathrm{C} 1-\mathrm{C} 12-$ $\mathrm{N} 1-\mathrm{C} 11\left[-4.5(2)^{\circ}\right]$ (Table 1). In the naphthalimide ring system, the characteristic pattern of bond lengths is observed. Specifically, bonds C7-C8, C5-C6, C3-C4 and $\mathrm{C} 1-\mathrm{C} 2$ are shorter (average value $1.380 \AA$ ) than the expected aromatic bond length, whereas all other bonds in the aromatic rings are longer than expected (average value $1.420 \AA$ ). This pattern of bond lengths has been observed previously in other $N$-substituted naphthalimide molecules (Clark \& Hall, 1989). The $\mathrm{C} 1-\mathrm{C} 12-\mathrm{N} 1$ and $\mathrm{C} 8-\mathrm{C} 11-\mathrm{N} 1$ bond angles are $3.2(1)^{\circ}$ smaller, and the $\mathrm{C} 1-\mathrm{C} 12-\mathrm{O} 2$ and $\mathrm{C} 8-\mathrm{C} 11-\mathrm{O} 1$ bond angles are $2.5(1)^{\circ}$ larger than $120^{\circ}$. The two neighboring angles $\mathrm{O} 1-\mathrm{C} 11-\mathrm{N} 1$ and $\mathrm{O} 2-\mathrm{C} 12-\mathrm{N} 1$ differ from $120^{\circ}$ by only 0.5 (1) and $0.6(1)^{\circ}$, respectively. The bond lengths and angles of the 3-methoxypropyl group are normal and in accordance with the anticipated values (Hädicke \& Graser, 1986).

In the crystal structure, the molecules are linked by a C $\mathrm{H} \cdots \mathrm{O}$ hydrogen bond between the naphthalene ring and the carbonyl group (Table 2), and form a hydrogen-bonded polymer extending in the $b$ direction.

## Experimental

The title compound was synthesized by refluxing 1,8 -naphthalic anhydride ( $1.98 \mathrm{~g}, 0.01 \mathrm{~mol}$ ) and 3-methoxy-1-aminopropane ( 0.89 g , 0.01 mol ) in concentrated acetic acid ( 50 ml ). The reaction mixture was refluxed for 8 h , then poured into cold water and the resulting solid was then filtered off. This solid product was boiled with an aqueous solution of sodium bicarbonate ( $10 \%, 50 \mathrm{ml}$ ) for 20 min and the insoluble solid residue was then dried in vacuo. Column chromatography on aluminium oxide with $\mathrm{C}_{6} \mathrm{H}_{6}$ as eluant gave the product as a light-brown solution. The resulting solution was evaporated to obtain brown crystals ( $78 \%$ yield; m.p. 369-370 K).
