## Key indicators

Single-crystal X-ray study
$T=293 \mathrm{~K}$
Mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$
$R$ factor $=0.043$
$w R$ factor $=0.121$
Data-to-parameter ratio $=18.5$

For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

## 3-[2-(2,4-Dichlorophenyl)vinyl]-2-methyl-1-phenylsulfonyl-1H-indole

The title compound, $\mathrm{C}_{23} \mathrm{H}_{17} \mathrm{Cl}_{2} \mathrm{NO}_{2} \mathrm{~S}$, crystallizes with $\mathrm{Z}^{\prime}=2$ in space group $P \overline{1}$. The dihedral angle between the indole moiety and the aromatic rings of the phenylsulfonyl and dichlorophenyl groups are $76.2(1)$ and $7.6(1)^{\circ}$ in molecule $A$, and 75.6 (1) and $11.6(1)^{\circ}$ in molecule $B$. The dihedral angle between the two aromatic rings is 79.7 (1) ${ }^{\circ}$ in molecule $A$ and $81.6(1)^{\circ}$ in molecule $B$. The molecular structure and molecular packing in the crystal are stabilized by $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ weak interactions.

## Comment

The indole ring system is present in a number of natural products, many of which are found to possess antibacterial (Okabe \& Adachi, 1998), antitumour (Schollmeyer et al., 1995), antidepressant (Grinev et al., 1984), antimicrobial (ElSayed et al., 1986; Gadaginamath \& Patil, 1999) and antiinflammatory (Rodriguez et al., 1985) activities. Sivaraman et al. (1996) have studied the interaction of phenylsulfonyl indoles with calf-thymus DNA, by spectroscopic methods. Indoles have been proved to display high aldose reductose inhibitory activity (Rajeswaran et al., 1999). The structure determination of the title compound, (I), was undertaken as part of our studies on indole derivatives.

(I)

The asymmetric unit contains two molecules, $A$ and $B$; the corresponding bond lengths and angles of these two molecules agree with each other and no conformational changes are observed. Bond lengths and angles in the indole moiety are comparable with those observed in related $N$-phenylsulfonyl indole derivatives (Sankaranarayanan et al., 2000; Sankaranarayanan, Yogavel, Velmurugan, Sekar, Babu et al., 2003; Sankaranarayanan, Yogavel, Velmurugan, Sekar, Srinivasan et al., 2003; SethuSankar et al., 2002; Govindasamy et al., 1998). The lengthening of $\mathrm{C}-\mathrm{N}$ bonds in the indole moiety is due to the electron-withdrawing character of the phenylsulfonyl group. The $\mathrm{S} 1-\mathrm{N} 1$ and $\mathrm{S} 1-\mathrm{C} 10$ bond distances are compar-

able with the respective mean values of 1.642 (24) and 1.758 (18) $\AA$ (Allen et al., 1987). In both molecules, the angular disposition of the bonds about the S atoms shows significant deviation from that of a regular tetrahedron, with the largest deviation being in the $\mathrm{O}-\mathrm{S}-\mathrm{O}$ angles. As previously reported, the widening of the $\mathrm{O}-\mathrm{S}-\mathrm{O}$ angle is presumably the result of repulsive interaction between the $\mathrm{S}=\mathrm{O}$ bonds (Rodriguez et al. 1985; Beddoes et al., 1986; Govindasamy et al., 1998; Sankaranarayanan et al., 2000, 2001; SethuSankar et al., 2002).

In both molecules, the dichlorophenyl ring is nearly coplanar with the indole ring system, with a dihedral angle of $7.6(1)^{\circ}$ in molecule $A$ and $11.6(1)^{\circ}$ in molecule $B$. The dihedral angle between the indole ring system and the sulfonyl-bound phenyl ring is $76.2(1)^{\circ}$ in molecule $A$ and $75.6(1)^{\circ}$ in molecule $B$. The sulfonylphenyl and dichlorophenyl rings are nearly orthogonal [dihedral angles 79.7 (1) and $81.5(1)^{\circ}$ ]. Atom N1 deviates from the plane passing through C2, C5 and S1 by 0.186 (2) $\AA$ in molecule $A$ and 0.179 (2) $\AA$ in molecule $B$, and the sum of the angles around N 1 is $355.4(1)^{\circ}$ in molecule $A$ and $355.7(1)^{\circ}$ in molecule $B$. This slight pyramidalization is also observed in related indole derivatives (Sankaranarayanan et al., 2000; Sankaranarayanan, Yogavel, Velmurugan, Sekar, Babu et al., 2003; Sankaranarayanan, Yogavel, Velmurugan, Sekar, Srinivasan et al., 2003; SethuSankar et al., 2002).

Both the molecular and crystal structures are stabilized by weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions. In the molecular structure, the orientations of the indole and phenyl subtituents with respect to the sulfonyl group are influenced by $\mathrm{C} 6-\mathrm{H} 6 \cdots \mathrm{O} 1$ and $\mathrm{C} 15-\mathrm{H} 15 \cdots \mathrm{O} 2$ weak interactions (Table 2). In the crystal structure, the $\mathrm{C} 19 A-\mathrm{H} 19 A \cdots \mathrm{O} 2 B$ and $\mathrm{C} 19 B-$

Figure 2

$\mathrm{H} 19 B \cdots \mathrm{O} 2 A(1+x, y, z)$ interactions link the molecules to form helices along the a direction (Fig. 2).

## Experimental

To a suspension of $\mathrm{NaH}(0.15 \mathrm{~g}, 6 \mathrm{mmol})$ in dry tetrahydrofuran (THF, 20 ml ) at room temperature was slowly added the $2,4-$ dichlorobenzyl phosphonium bromide ( 6 mmol ) in dry THF ( 40 ml ) under $\mathrm{N}_{2}$ and stirred for 1 h . A solution of 1-phenylsulfonyl-2-methylindole-3-carbaldehyde (1 equivalent, 6 mmol ) in dry THF $(20 \mathrm{ml})$ was then added. Stirring was continued for another 2 h . The red-brown solution was poured over ice $(200 \mathrm{~g})$ containing saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution. Then it was extracted with dichloromethane and the organic extract was washed with water $(3 \times 25 \mathrm{ml})$, dried over $\mathrm{MgSO}_{4}$ and filtered. Removal of solvent and chromatographic separation on a silica-gel column by elution with hexane-ethyl acetate (9:1) afforded the title compound.

Symmetry code: (i) $1+x, y, z$.
The H atoms were fixed geometrically and treated as riding atoms on the parent C atoms, with aromatic $\mathrm{C}-\mathrm{H}=0.93 \AA$ and methyl $\mathrm{C}-$ $\mathrm{H}=0.96 \AA$. Rotating group refinement was used for the methyl groups.
