## Key indicators

Single-crystal X-ray study  
 $T = 293$  K  
Mean  $\sigma(\text{C}-\text{N}) = 0.002$  Å  
 $R$  factor = 0.027  
 $wR$  factor = 0.068  
Data-to-parameter ratio = 29.7For details of how these key indicators were  
automatically derived from the article, see  
<http://journals.iucr.org/e>.Bis(1-carbamoylguanidinium) diaquatetra-  
chlorocobaltate(II)

The crystal structure of the title compound,  $(\text{C}_2\text{H}_7\text{N}_4\text{O})_2[\text{CoCl}_4(\text{H}_2\text{O})_2]$ , contains a molecular network of  $(\text{C}_2\text{H}_7\text{N}_4\text{O})^+$  cations and  $\text{trans}-[\text{Co}(\text{H}_2\text{O})_2\text{Cl}_4]^{2-}$  octahedral anions (Co site symmetry  $2/m$ ). An extensive network of  $\text{N}-\text{H}\cdots\text{Cl}$ ,  $\text{N}-\text{H}\cdots(\text{Cl},\text{Cl})$ ,  $\text{N}-\text{H}\cdots\text{O}$ ,  $\text{O}-\text{H}\cdots\text{O}$  and  $\text{O}-\text{H}\cdots\text{Cl}$  hydrogen bonds results in a structure with a three-dimensional hydrogen-bond network.

## Comment

The title compound, (I), arose as a side product during our synthetic investigations of organically templated cobalt phosphate networks (Cowley & Chippindale, 1999). It is isostructural with  $(\text{C}_2\text{H}_7\text{N}_4\text{O})_2[\text{CuCl}_4(\text{H}_2\text{O})_2]$  (Begley *et al.*, 1988) and  $(\text{C}_2\text{H}_7\text{N}_4\text{O})_2[\text{MnCl}_4(\text{H}_2\text{O})_2]$  (Bremner & Harrison, 2003).

In (I), Co1 (site symmetry  $2/m$ ) has flattened, *trans*, octahedral coordination by two O (water) atoms and four Cl atoms. The *cis* bond angles lie between  $84.64(3)$  and  $95.36(3)^\circ$ . The Co—O bond distance of  $2.1000(9)$  Å and the average Co—Cl separation of  $2.4695(4)$  Å correlate reasonably well with the ionic radius (IR) sums for the species involved [ $d_{\text{IR}}(\text{Co}-\text{O}) = 2.09$  Å and  $d_{\text{IR}}(\text{Co}-\text{Cl}) = 2.56$  Å], assuming the presence of high-spin  $\text{Co}^{2+}$  (Shannon, 1976). The  $[\text{CuCl}_4(\text{H}_2\text{O})_2]^{2-}$  grouping in  $(\text{C}_2\text{H}_7\text{N}_4\text{O})_2[\text{CuCl}_4(\text{H}_2\text{O})_2]$  (Begley *et al.*, 1988) is much more distorted, with a Cu—O distance of  $1.992(3)$  Å and Cu—Cl bond lengths of  $2.305(1)$  and  $2.791(1)$  Å, which can be ascribed to a typical Jahn–Teller distortion for the  $d^9$   $\text{Cu}^{2+}$  species.

The 1-carbamoylguanidinium (guanylurea) cation has normal geometrical parameters [ $d_{\text{av}}(\text{N}-\text{C}) = 1.339(3)$  Å], indicating significant delocalization of electrons over the non-hydrogen skeleton (Zaman & Darlow, 1986; Begley *et al.*, 1988) and is essentially planar (for the non-H atoms, the r.m.s. deviation from the least-squares plane =  $0.029$  Å). A very acute ( $\theta = 129^\circ$ ) intramolecular  $\text{N4}-\text{H9}\cdots\text{O2}$  hydrogen bond is present, which is typical for  $(\text{C}_2\text{H}_7\text{N}_4\text{O})^+$  (Bremner & Harrison, 2002).

**Figure 1**  
Component species of (I) (50% displacement ellipsoids, arbitrary spheres for the H atoms and hydrogen bonds indicated by dashed lines). [Symmetry code: (i)  $-x, 1 - y, -z$ .]

**Figure 2**  
Detail of (I), showing an [010] stack of alternating cation pairs and anions. Colour key:  $\text{Co}(\text{H}_2\text{O})_2\text{Cl}_4$  octahedra purple, Cl atoms green, C atoms blue, N atoms yellow, and H atoms grey (all radii arbitrary). The intramolecular  $\text{H}\cdots\text{O}$ , other  $\text{H}\cdots\text{O}$ ,  $\text{H}\cdots\text{Cl}$  portions of the hydrogen bonds and the pseudo- $\pi$ - $\pi$ -stacking contacts (see text) are coloured light blue, orange, yellow, and purple, respectively.

The component species in (I) interact by way of an extensive hydrogen-bonding network (Table 2). The  $\text{N}-\text{H}\cdots\text{Cl}$  hydrogen bonds to chloride ion acceptors involving H5 and H6 are bifurcated [ $d_{\text{av}}(\text{H}\cdots\text{Cl}) = 2.72 \text{ \AA}$ ,  $d_{\text{av}}(\text{N}\cdots\text{Cl}) = 3.398(2) \text{ \AA}$  and  $\theta_{\text{av}}(\text{N}-\text{H}\cdots\text{Cl}) = 138^\circ$ ], which is a characteristic 'synthon' bonding motif for these species (Brammer *et al.*, 2001). In this case, the pairs of chloride ions occupy an octahedral edge, with  $\text{Cl1}\cdots\text{Cl2}$  and  $\text{Cl1}^{\text{v}}\cdots\text{Cl2}^{\text{iv}}$  [symmetry codes: (iv)  $\frac{1}{2} + x, \frac{3}{2} - y, \frac{1}{2} + z$ ; (v)  $\frac{1}{2} - x, \frac{1}{2} + y, \frac{1}{2} - z$ .] separations of 3.4662(5) and 3.5190(5)  $\text{ \AA}$  for the interactions involving H5 and H6, respectively. The hydrogen bonds involving H3, H7 and H8 are simple  $\text{N}-\text{H}\cdots\text{Cl}$  links [ $d_{\text{av}}(\text{H}\cdots\text{Cl}) = 2.52 \text{ \AA}$ ,  $d_{\text{av}}(\text{N}\cdots\text{Cl}) = 3.329(2) \text{ \AA}$  and  $\theta_{\text{av}}(\text{N}-\text{H}\cdots\text{Cl}) = 159^\circ$ ]. Overall, Cl1 accepts three and Cl2 accepts five hydrogen bonds.

The hydrogen-bonding scheme in (I) results in stacks of alternating  $[\text{Co}(\text{H}_2\text{O})_2\text{Cl}_4]^{2-}$  octahedra and pairs of 1-carbamoylguanidinium species propagating along [010] (Fig. 2), which are held together by the  $\text{O1}-\text{H1}\cdots\text{O2}^{\text{i}}$ ,  $\text{N1}-\text{H3}\cdots\text{Cl1}^{\text{iii}}$ ,  $\text{N3}-\text{H6}\cdots\text{Cl2}^{\text{iv}}$ , and  $\text{N4}-\text{H8}\cdots\text{Cl2}^{\text{iv}}$  bonds (see Table 2 for the acceptor-atom symmetry codes). There may be pseudo  $\pi$ - $\pi$ -stacking interactions involving the parallel 1-carbamoylguanidinium pairs, with resulting short contact distances of  $\text{Cl1}\cdots\text{N4}^{\text{vi}} = 3.346(2) \text{ \AA}$  and  $\text{C2}\cdots\text{O2}^{\text{vi}} = 3.364(2) \text{ \AA}$  [symmetry code: (vi)  $1 - x, 1 - y, 1 - z$ ].

**Figure 3**  
Unit-cell packing in (I), viewed down [010]. Colour key as in Fig. 2 (pseudo- $\pi$ - $\pi$ -stacking contacts have been omitted for clarity).

The stacks are fused into  $(10\bar{1})$  pseudo-sheets by way of the  $\text{N1}-\text{H4}\cdots\text{O1}$ ,  $\text{N2}-\text{H5}\cdots(\text{Cl1}, \text{Cl2})$ ,  $\text{N3}-\text{H6}\cdots\text{Cl1}^{\text{v}}$ , and  $\text{N3}-\text{H7}\cdots\text{Cl2}$  bonds, which in turn are crosslinked by the  $\text{O1}-\text{H2}\cdots\text{Cl2}^{\text{ii}}$  bonds (symmetry codes as in Table 2), resulting in a three-dimensional structure.

## Experimental

10 ml of 1 M  $\text{CoCl}_2$  solution, 10 ml of 1 M  $\text{H}_3\text{PO}_4$  solution and 0.5 g dicyandiamide were mixed together in a plastic bottle and heated to 353 K for 24 h, resulting in a purple solution. The solution was cooled to room temperature, and rod-like crystals of (I) grew as the solvent slowly evaporated. The dicyandiamide was transformed to guanlyurea by slow acid hydrolysis.
