Key indicators

Single-crystal X-ray study
 $T = 293\text{ K}$
Mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$
 R factor = 0.049
 wR factor = 0.115
Data-to-parameter ratio = 21.2

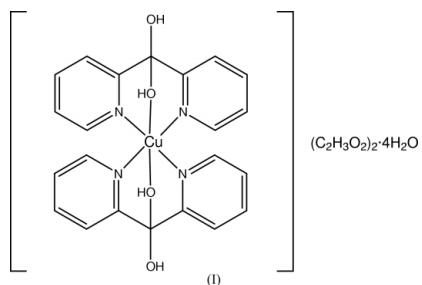

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

The crystal structure of $[\text{Cu}(\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}_2)_2](\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 4\text{H}_2\text{O}$ reveals an extended $\text{O}-\text{H}\cdots\text{O}$ hydrogen-bond network between helicoidal chains of water molecules and layers of $[\text{Cu}(N,O,N'-dpkdiol)_2]^{2+}$ complex cations and acetate anions held together by means of carboxylate-diol hydrogen bonds. The cation has crystallographic inversion symmetry.

Comment

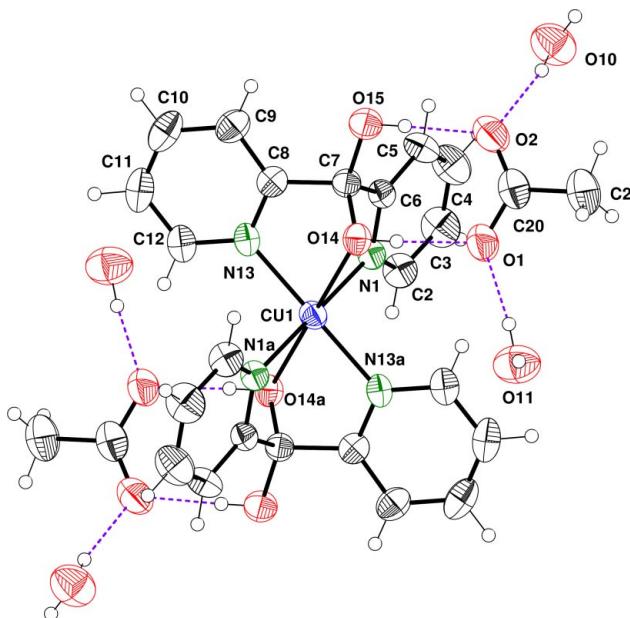

The di-2-pyridyl-ketone ligand (dpk) has been observed to undergo hydration of the ketocarbonyl group, forming a *gem*-diol after initial N,N' -coordination to a transition metal (Wang *et al.*, 1986). This *gem*-diol ligand (dpkdiol) can coordinate both as an N,N' -bidentate ligand (Parker *et al.*, 2000) or as an N,O,N' -tridentate ligand, either protonated (Sommerer *et al.*, 1993; Tangoulis *et al.*, 1997; Yang *et al.*, 1998; Serna *et al.*, 1999) or deprotonated (Sommerer *et al.*, 1990; Breeze *et al.*, 1996; Tong *et al.*, 1998; Hemmert *et al.*, 1999; Woltz *et al.*, 2002). The title complex, (I), which was obtained in an attempt to prepare a copper-dpk-Keggin complex, consists of $[\text{Cu}(N,O,N'-dpkdiol)_2]^{2+}$ complex cations, acetate anions and uncoordinated water molecules.

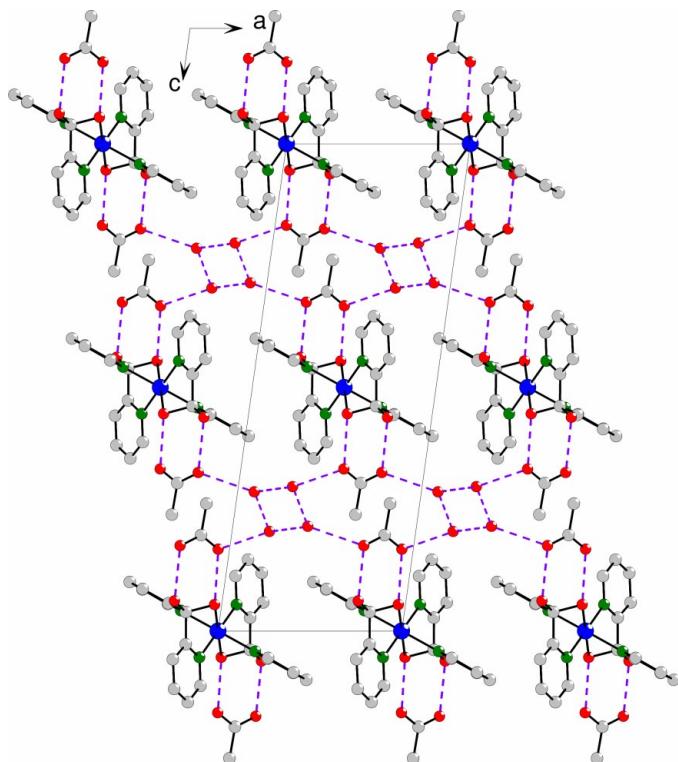

The Cu atom lies in a distorted elongated octahedral CuN_4O_2 environment. The equatorial coordination positions are occupied by the N atoms of the dpkdiol ligands, while two hydroxyl groups occupy the axial ones. The two hydroxyl groups of the ligands and the acetate anions form two strong face-to-face carboxylate-diol hydrogen bonds, leading to trimolecular entities built up of one cationic complex and two acetate anions (Fig. 1). These entities are placed in layers parallel to the (001) plane, which are connected by an extended $\text{O}-\text{H}\cdots\text{O}$ hydrogen-bond network between the O atoms of the acetate anions and helicoidal chains of water running parallel to the *b* axis (Fig. 2).

Experimental

A solution containing 68 mg of $\text{CuCl}_2 \cdot 2\text{H}_2\text{O}$, 25 mg of oxalic acid and 74 mg of dpk in 30 ml of water and 10 ml of methanol was added to a solution of 667 mg of $\text{K}_4\text{SiW}_{12}\text{O}_{40}$ in 50 ml of water and a violet

Symmetry codes: (ii) $-\frac{1}{2} - x, \frac{1}{2} + y, -\frac{1}{2} - z$; (iii) $1 + x, y, z$.

The H atoms of the water molecules and hydroxyl groups of the dpkdiol ligand were located in a Fourier difference map. The positions of all remaining H atoms were calculated geometrically. Water molecule H atoms were refined with the O—H distance constrained to 0.85 (1) Å. All remaining H atoms were refined as riding, with isotropic displacement parameters fixed at 1.2 (aromatic C) or 1.5 (methyl and hydroxyl groups) times the equivalent isotropic displacement parameters of their parent atoms.
