## Key indicators

Single-crystal X-ray study
$T=100 \mathrm{~K}$
Mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$
$R$ factor $=0.042$
$w R$ factor $=0.113$
Data-to-parameter ratio $=22.8$

For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

## (E)-3-Hexene-1,6-diyl dibenzoate

The title molecule, $\mathrm{C}_{20} \mathrm{H}_{20} \mathrm{O}_{4}$, lies on an inversion center. The central alkene moiety is not coplanar with the remainder of the molecule, forming a dihedral angle of $61.61(12)^{\circ}$ with the $\mathrm{O}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{C}$ plane and a dihedral angle of $58.70(11)^{\circ}$ with the phenyl plane. The central $\mathrm{C}=\mathrm{C}$ length is 1.326 (2) $\AA$.

## Comment

During an attempted cross metathesis reaction, the title compound, (I), was produced in an interesting side reaction. Such cross metathesis reactions, which tend to be unpredictable, occur between two olefins in the presence of an Ru catalyst known as Hoyveda's catalyst (Garber et al., 2000). In the reaction, an olefin first reacts with the Ru catalyst, and then the highly reactive intermediate reacts with a different olefin. In this case, the second step was reaction of another molecule of the first olefin, but-3-enyl benzoate, to form the title dimer. The crystal structure determination was carried out in order to identify the unexpected product.

(I)

The molecule, which lies on a crystallographic inversion center, is illustrated in Fig. 1. The central 3-hexene moiety is nonplanar, with torsion angle $\mathrm{C} 3-\mathrm{C} 2-\mathrm{C} 1-\mathrm{C1}^{\mathrm{i}}$ of $-121.21(14)^{\circ}$, yielding the dihedral angles given in the abstract [symmetry code: (i) $1-x, 1-y, 1-z$ ].

The title compound has been previously reported as an intermediate in the synthesis of the corresponding 3,4-diol (Torneiro \& Still, 1997).

## Experimental

To 15 ml tetrahydrofuran were added but-3-enyl benzoate $(0.10 \mathrm{~g}$, $0.56 \mathrm{mmol}, 1 \mathrm{eq}$.) and methyl vinyl ketone ( $0.85 \mathrm{~g}, 11.2 \mathrm{mmol}, 20 \mathrm{eq}$.). Hoyveda's catalyst ( $0.018 \mathrm{~g}, 0.028 \mathrm{mmol}, 0.05 \mathrm{eq}$ ) (Garber et al., 2000) was added to the flask in 5 ml dichloromethane. The reaction mixture was stirred until the reaction was complete by TLC. The reaction mixture was purified by column chromatography, to obtain the title compound after removal of solvent.

Symmetry code: (i) $1-x, 1-y, 1-z$.
H atoms were placed in idealized positions, with $\mathrm{C}-\mathrm{H}$ bond distances $0.95-0.99 \AA$, and thereafter treated as riding. Displacement parameters for H were assigned as $U_{\text {iso }}=1.2 U_{\text {eq }}$ of the attached atom.

Figure 1
The title compound, showing the atomic numbering scheme, with displacement ellipsoids drawn at the $50 \%$ level.

Data collection: COLLECT (Nonius, 2000); cell refinement: DENZO and SCALEPACK (Otwinowski \& Minor, 1997); data reduction: $D E N Z O$ and $S C A L E P A C K$; program(s) used to solve structure: SIR97 (Altomare et al., 1999); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: ORTEP-3 (Farrugia, 1997); software used to prepare material for publication: SHELXL97.

The purchase of the diffractometer was made possible by Grant No. LEQSF(1999-2000)-ESH-TR-13, administered by the Louisiana Board of Regents.
