## Key indicators

Single-crystal X-ray study
$T=293 \mathrm{~K}$
Mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$
$R$ factor $=0.046$
$w R$ factor $=0.126$
Data-to-parameter ratio $=19.2$
For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

## Ethyl 4-[1-(4-bromophenyl)-3-methyl-5-oxo-4,5-dihydro-1H-1,2,4-triazol-4-yliminomethyl]phenoxyacetate

In the crystal structure of the title compound, $\mathrm{C}_{20} \mathrm{H}_{19} \mathrm{BrN}_{4} \mathrm{O}_{4}$, the asymmetric unit consists of two crystallographically independent molecules, which differ in the relative orientations of the triazole and phenyl rings. In the crystal structure, both molecules form approximately centrosymmetric dimers through weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ intermolecular interactions.

## Comment

The triazole moiety possesses many pharmacological properties, such as acting as an antimicrobial (Habib et al., 1997), antiviral (Ergen et al., 1996), anti-HIV-1 (Invidiata et al., 1996), antifungal, antimycobacterial and anticonvulsant agent (Gülerman et al., 1997). It is also a highly potent eosinophilia inhibitor (Naito et al., 1996) and is used as a fungicide (Crofton, 1996) and herbicide (Tada et al., 1995). Some triazole derivatives have been evaluated for their antibacterial activity against both Gram-positive and Gram-negative bacteria (Bs et al., 1996). In view of these important attributes, the structure determination of the title compound, (I), was performed.

A perspective view of (I), including the atomic numbering scheme, is shown in Fig. 1. The asymmetric unit consists of two crystallographically independent molecules. The overall r.m.s fit of these molecules is $0.233 \AA$. The corresponding bond distances and angles in the independent molecules agree with each other, but the two molecules differ in the relative orientations of the mean planes of the $A / B$ and $B / C$ rings, with dihedral angles of $3.83(11) \quad\left[10.24(11)^{\circ}\right]$ and $3.70(9)$ [14.14 (11) ${ }^{\circ}$ ], respectively. The dihedral angle between the mean planes of rings $A$ and $C$ is $5.32(11)^{\circ}\left[3.91(10)^{\circ}\right]$ (values in brackets are for molecule $B$ ). The bond lengths and angles of the triazole moiety in (I) are unexceptional, and comparable with those reported for related structures (Chen et al., 1998; Wang et al., 1998; Thamotharan, Parthasarathi, Sunagar et al., 2003; Thamotharan, Parthasarathi, Hunnur et al., 2003; Thamotharan, Parthasarathi, Kavali et al., 2003). In (I), the $\mathrm{N} 4 A-\mathrm{N} 12 A-\mathrm{C} 13 A-\mathrm{C} 14 A$ torsion angle of $-178.3(2)^{\circ}$ [ $-177.3(2)^{\circ}$ for molecule $B$ ] indicates that the imine group has an $E$ configuration. The ethoxycarbonylmethoxy group is oriented at an angle of $29.42(15)^{\circ}\left[31.33(17)^{\circ}\right]$ with respect to the mean plane of ring $C$.

Received 21 July 2003 Accepted 31 July 2003 Online 8 August 2003

Figure 1
View of the two independent molecules of (I), showing the atom-labelling scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level. H atoms are represented by circles of arbitrary radii.

Figure 2
The $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ contacts in two dimers of (I) [symmetry code: (\#) $-x$, $2-y, 1-z$, i.e. (ii) in Table 2].

The substituted phenyl ring at N 2 of the triazole ring is almost coplanar [ $3.83(11)^{\circ}$; $10.24(10)^{\circ}$ for molecule $B$ ] with the triazole ring, while the corresponding angles in the chloro (Thamotharan, Parthasarathi, Sunagar et al., 2003; Thamotharan, Parthasarathi, Kavali et al., 2003) and bromo (Thamotharan, Parthasarathi, Hunnur et al., 2003) derivatives of triazole are $30.63(9) / 4.86(5)$ and $8.93(14)^{\circ}$, respectively.

The exocyclic angles $\mathrm{C} 16 A-\mathrm{C} 17 A-\mathrm{O} 29 A$, $\mathrm{O} 22 A-$ $\mathrm{C} 22 A-\mathrm{O} 23 A$ and $\mathrm{O} 22 A-\mathrm{C} 22 A-\mathrm{C} 21 A$ deviate significantly from the normal value of $120^{\circ}$ (Table 1); this may be due to steric repulsion $[\mathrm{H} 16 A \cdots \mathrm{H} 21 A=2.16 \AA(\mathrm{H} 16 B \cdots \mathrm{H} 21 D=$ $2.13 \AA$ in molecule $B$ ) and $\mathrm{H} 24 B \cdots \mathrm{O} 22 A=2.41 \AA$ ( $\mathrm{H} 24 D \cdots \mathrm{O} 22 B=2.37 \AA$ in molecule $B$ )].

In the crystal structure, atom $\mathrm{C} 8 B$ of molecule $B$ acts as donor for a weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interaction with the carbonyl atom $\mathrm{O} 22 B$ of the centrosymmetrically related molecule at $(-x, 2-y,-z)$, which leads to an $R_{2}^{2}(34)$ motif. Atoms $\mathrm{C} 10 A$ and $\mathrm{C} 10 B$ are involved in weak intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions with atoms $\mathrm{O} 3 B$ and $\mathrm{O} 3 A$ of the centrosymmetrically related molecules at $(-x, 2-y, 1-z)$
(Fig. 2) and each interaction has a graph-set motif of $R_{2}^{2}(14)$ (Bernstein et al., 1995).

## Experimental

The title compound was prepared by heating 4-amino-2( $p$-bromophenyl)-5-methyl-2,4-dihydro-3H-1,2,4-triazol-3-one with $p$-hydroxybenzaldehyde to give the corresponding hydrazone, and then further reaction with ethyl bromoacetate in the presence of dry $\mathrm{K}_{2} \mathrm{CO}_{3}$ and KI. The solid obtained, (I), was crystallized from acetone (m.p. $428-431 \mathrm{~K}$ ). The crystal was bounded by the $\{010\},\{01 \overline{1}\}$ and \{610 0 pinacoids.

| C10B-H10B $\cdots \mathrm{O}^{\text {ii }}$ | 0.93 | 2.39 | $3.314(3)$ | 171 |

Symmetry codes: (i) $-x, 2-y,-z$; (ii) $-x, 2-y, 1-z$.

Methyl H atoms were constrained to an ideal geometry $(\mathrm{C}-\mathrm{H}=$ $0.96 \AA$ ), with $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C})$, but were allowed to rotate freely about the parent $\mathrm{C}-\mathrm{C}$ bond. All remaining H atoms were placed in geometrically idealized positions $(\mathrm{C}-\mathrm{H}=0.93-0.97 \AA)$ and constrained to ride on their parent atoms, with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})$.

Data collection: IPDS (Stoe \& Cie, 1997); cell refinement: IPDS; data reduction: IPDS; program(s) used to solve structure: DIRDIF99 (Beurskens et al., 1999); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: ORTEP3 (Farrugia, 1997); software used to prepare material for publication: SHELXL97 and PLATON (Spek, 2003).

BB and VS are grateful to Dr G. S. Puranik, Retired Professor of Organic Chemistry, Karnatak University, Dharwad, for valuable suggestions and encouragement.
