## Key indicators

Single-crystal X-ray study

$T = 293\text{ K}$

Mean  $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$

Disorder in solvent or counterion

$R$  factor = 0.057

$wR$  factor = 0.155

Data-to-parameter ratio = 13.7

For details of how these key indicators were  
automatically derived from the article, see  
<http://journals.iucr.org/e>.

The title compound,  $\text{C}_{22}\text{H}_{20}\text{ClN}_3\text{O}_3\text{S}\cdot 1.5\text{C}_6\text{H}_6$ , was synthesized by the intermolecular [3 + 2]-cycloaddition of azomethine ylide, derived from isatin and sarcosine by a decarboxylative route, and 5-(4-chlorobenzylidene)-3-ethylthiazolidine-2,4-dione. In the molecule of the title compound, an approximately planar 2-oxindole system, a pyrrolidine ring in an envelope conformation, and a planar thiazolidine ring are joined *via* two spiro-junctions. The molecules in the crystal are linked by an intermolecular  $\text{N}-\text{H}\cdots\text{N}$  hydrogen bond [ $\text{N}\cdots\text{N} = 3.071(3)\text{ \AA}$ ], forming infinite chains running along the  $c$  axis. One of the solvate benzene molecules occupies a special position on an inversion centre.

## Comment

Spiro-compounds represent an important class of naturally occurring substances, which in many cases exhibit interesting biological properties (Kobayashi *et al.*, 1991; James *et al.*, 1991). 1,3-Dipolar cycloaddition reactions are widely used for the construction of spiro-compounds (Caramella & Grunanger, 1984). In this paper, the structure of the title compound, (I), is reported. The compound was synthesized by the intermolecular [3 + 2]-cycloaddition of azomethine ylide, derived from isatin and sarcosine by a decarboxylative route, and 5-(4-chlorobenzylidene)-3-ethylthiazolidine-2,4-dione.

The molecular structure of (I) is shown in Fig. 1. The molecule involves 2-oxindole, pyrrolidine, and thiazolidine moieties, joined *via* two spiro-junctions. The pyrrolidine ring  $\text{N}2-\text{C}5-\text{C}4-\text{C}3-\text{C}6$  has an envelope conformation; atom  $\text{N}2$  is displaced by  $0.618(3)\text{ \AA}$  from the mean plane of the  $\text{C}5/\text{C}4/\text{C}3/\text{C}6$  atoms [plane  $A$ ; maximum deviation of atom  $\text{C}4$  is  $0.031(3)\text{ \AA}$ ]. The  $\text{C}5/\text{N}2/\text{C}6$  plane forms a dihedral angle of  $135.6(2)^\circ$  with plane  $A$ , whereas the dihedral angle of the latter with the mean plane of the benzene ring ( $\text{C}10-\text{C}15$ ) is  $76.7(3)^\circ$ . Both the bicyclic indole system and the thiazolidine ring are almost planar [maximum deviations of atoms  $\text{C}17$  and  $\text{C}2$  from their respective mean planes are  $0.035(3)$  and  $0.041(4)\text{ \AA}$ ]; their planes are approximately orthogonal to plane  $A$ ; the dihedral angles are equal to  $78.3(2)$  and  $88.7(3)^\circ$ , respectively. Atoms  $\text{O}1$  and  $\text{O}2$  are displaced from the mean

**Figure 1**  
The molecular structure of (I); displacement ellipsoids are drawn at the 30% probability level, H atoms have been omitted and solvate benzene molecules are not shown.

plane of the thiazolidine cycle by 0.027 (2) and  $-0.155$  (2) Å, respectively.

There is one 'active' H atom in the molecule which participates in the intermolecular  $N3-H3 \cdots N2^i$  hydrogen bond [symmetry code: (i)  $x, \frac{1}{2} - y, z - \frac{1}{2}$ ] (Table 1). This hydrogen bond links the molecules of (I) in to infinite chains running along the  $c$  axis (Fig. 2).

## Experimental

A mixture of 5-(4-chlorobenzylidene)-3-ethylthiazolidine-2,4-dione (2 mmol), prepared according to Lo *et al.* (1958), isatin (2 mmol), and sarcosine (2 mmol) was refluxed in dioxane (30 ml) until the disappearance of the starting material (as monitored by thin-layer chromatography). When the reaction was complete, the solvent was removed *in vacuo* and the residue was separated by column chromatography (silica gel, petroleum ether/ethyl acetate 5:1) to give the title compound, (I). M.p. 476 K; IR (KBr): 3358.3 (–NH), 1750.2, 1718.7, 1685.9 (C=O)  $\text{cm}^{-1}$ ;  $^1\text{H}$  NMR ( $\text{CDCl}_3$ , p.p.m.): 0.87 (*t*, 3H,  $\text{CH}_3$ ), 2.26 (*s*, 3H, N–CH<sub>3</sub>), 3.40–3.50 (*m*, 2H, –CH<sub>2</sub>), 3.61 (*dd*,  $J = 9.3, 7.8$  Hz, 1H, Hc), 4.03 (*dd*,  $J = 10.2, 9.3$  Hz, 1H), 4.58 (*dd*,  $J = 10.2, 7.8$  Hz, 1H), 6.82–7.38 (*m*, 8H, Ar–H), 7.41 (*br*, 1H, –NH);  $^{13}\text{C}$  NMR (p.p.m.): 12.68, 35.18, 36.95, 51.33, 58.29, 72.12, 79.90, 110.31, 123.13, 123.22, 127.01, 128.81, 130.61, 131.46, 133.69, 136.16, 142.39, 169.38, 175.42, 177.50. 20 mg of (I) were dissolved in 15 ml of benzene and the solution was kept at room temperature for 15 d. Slow evaporation of the solvent afforded colorless single crystals of (I) suitable for X-ray analysis.

### Crystal data

$\text{C}_{22}\text{H}_{20}\text{ClN}_3\text{O}_3\text{S} \cdot 1.5\text{C}_6\text{H}_6$   
 $M_r = 559.08$   
 Monoclinic,  $P2_1/c$   
 $a = 11.132$  (3) Å

**Figure 2**  
The crystal packing diagram for (I), viewed along the  $a$  axis. All H atoms, with the exception of atom H3, participating in the hydrogen bond, have been omitted. Hydrogen bonds are shown as dashed lines.

### Data collection

Bruker SMART CCD area detector diffractometer	5070 independent reflections
$\varphi$ and $\omega$ scans	2701 reflections with $I > 2\sigma(I)$
Absorption correction: multi-scan (SADABS; Bruker, 1997)	$R_{\text{int}} = 0.046$
$T_{\text{min}} = 0.796, T_{\text{max}} = 0.923$	$\theta_{\text{max}} = 25.0$ °
14461 measured reflections	$h = -12 \rightarrow 13$
	$k = -27 \rightarrow 15$
	$l = -14 \rightarrow 14$

### Refinement

Refinement on $F^2$	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.057$	$w = 1/[\sigma^2(F_o^2) + (0.084P)^2]$
$wR(F^2) = 0.155$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.02$	$(\Delta/\sigma)_{\text{max}} < 0.001$
5070 reflections	$\Delta\rho_{\text{max}} = 0.27$ e Å <sup>-3</sup>
370 parameters	$\Delta\rho_{\text{min}} = -0.23$ e Å <sup>-3</sup>

**Table 1**

Hydrogen-bonding geometry (Å, °).

$D-H \cdots A$	$D-H$	$H \cdots A$	$D \cdots A$	$D-H \cdots A$
$N3-H3 \cdots N2^i$	0.86	2.39	3.071 (3)	136

Symmetry code: (i)  $x, \frac{1}{2} - y, z - \frac{1}{2}$ .

All H atoms were placed in calculated positions, with C–H distances ranging from 0.93 to 0.98 Å and an N–H distance of 0.86 Å. They were included in the refinement in the riding-model approximation, with  $U_{\text{iso}} = 1.2$  (1.5 for methyl) times  $U_{\text{eq}}$  of the carrier atom. Both solvate benzene molecules refined poorly. In the final model, the benzene molecule in the general position was included with the fixed geometry of a regular hexagon (C–C = 1.39 Å). The solvate benzene molecule located about an inversion centre was represented as two-component disorder with approximately equal occupancy factors, which refined to 0.49 (3) and 0.51 (3). The bond lengths in both components of the disordered benzene were constrained to 1.39 (1) Å.

Data collection: SMART (Bruker, 1997); cell refinement: SMART; data reduction: SAINT (Bruker, 1997); program(s) used to solve
