The structure of the title molecule,  $\text{C}_{10}\text{H}_{12}\text{O}_3$ , is stabilized by an intramolecular  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bond. In the crystal structure, the glide-related molecules are linked by  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds to form molecular chains along [201]. The structure is further stabilized by  $\pi\cdots\pi$  interactions.

## Comment

The title compound, (I), was isolated from *Aspergillus clavatus*, as a phenolic substance (Bergel *et al.*, 1944) lacking antibacterial activity (Gatenbeck & Brunsberg, 1966; Hasall & Todd, 1947). However, our studies show that it exhibits relative antifungal activity toward *Candida albicans* and *Aspergillus niger* with MIC (Minimum Inhibitory Concentration) of 20 and 40  $\mu\text{g ml}^{-1}$ , respectively, as well as moderate antitumor activity against the Raji, KB and A549 cancer cell lines with  $\text{IC}_{50}$  values of 9.1, 6.1, and 14.5  $\mu\text{g ml}^{-1}$ , respectively (Li, 2003). Here we report the structure of (I).

The title molecule, as a whole, excluding H atoms, is planar within 0.062 (2)  $\text{\AA}$  (Fig. 1 and Table 1). The planarity is stabilized by an  $\text{O}-\text{H}\cdots\text{O}$  intramolecular hydrogen bond involving atoms O1 and O2 (Table 2). The crystal structure shows that the glide-related molecules are linked by  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds involving a hydroxyl group and the

carbonyl O atom to form molecular chains running approximately along [201] (Fig. 2). Furthermore, the glide-related molecules are stacked along the *c* axis, with the centroids of the aromatic rings separated by 3.618 (1) Å, indicating significant  $\pi \cdots \pi$  interactions.

## Experimental

The title compound was isolated from *Aspergillus sp.* strain BYY-1, an endophytic fungus of *Avicennia marina* that was collected from the mangrove forest in Fujian Province, People's Republic of China. Crystals were grown using methanol as solvent.

All H atoms were positioned geometrically and were included in the refinement in the riding-model approximation [ $C-H = 0.93-0.96 \text{ \AA}$ ,  $O-H = 0.82 \text{ \AA}$  and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{parent atom})$ ]. A rotating-group model was used for the methyl and hydroxyl groups.
