## Diamminehexabromodiscandium(III)

The title compound, $\left[\mathrm{Sc}_{2} \mathrm{Br}_{6}\left(\mathrm{NH}_{3}\right)_{2}\right]$, was obtained by the reaction of ammonium bromide, $\left(\mathrm{NH}_{4}\right) \mathrm{Br}$, with scandium metal in a sealed tantalum metal container. The crystal structure contains zigzag chains of edge-connected [ $\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{5}$ ] octahedra according to the formulation $\left[\mathrm{Sc}\left(\mathrm{NH}_{3}\right)_{1 / 1} \mathrm{Br}_{1 / 1} \mathrm{Br}_{4 / 2}\right] . \quad \mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{3} \quad$ is isotypic with $\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Cl}_{3}$.

## Comment

Non-noble metals may be oxidized by an $H$ atom of the ammonium ion and incorporated in complexes such as ammonium salts or ammoniates (Meyer, 1994). The reaction of ammonium bromide, $\left(\mathrm{NH}_{4}\right) \mathrm{Br}$, with scandium yielded $\left(\mathrm{NH}_{4}\right)_{2}\left[\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{5}\right]$ (Böhmer \& Meyer, 2001) with the erythrosiderite-type structure. A closer inspection of this reaction has now resulted in the isolation of single crystals of the mono- and diammoniates of scandium(III) bromide, $\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{3}$ and $\mathrm{Sc}\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Br}_{3}$. Both compounds crystallize isostructurally with the respective chlorides, $\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Cl}_{3}$ and $\mathrm{Sc}\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Cl}_{3}$ (Meyer \& Klein, 2002). The crystal structure of the monoammoniate, $\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{3}$, is presented here.

In $\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{3}$, the $\mathrm{Sc}^{3+}$ cation is surrounded octahedrally by five bromide ions and one ammonia molecule. The $\mathrm{Sc}-\mathrm{N}$ distances [2.252 (7) and 2.244 (7) $\AA$ ] are very similar to the corresponding distances in $\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Cl}_{3}$. The $\mathrm{Sc}-\mathrm{Br}$ distances are between 2.532 (2) and 2.720 (2) $\AA$, with an average of 2.648 (2) A. Considering the difference between the ionic radii of $\mathrm{Cl}^{-}$and $\mathrm{Br}^{-}$of about $0.15 \AA$, this value compares very well with the mean $\mathrm{Sc}-\mathrm{Cl}$ distance in $\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Cl}_{3}$ of $2.499 \AA$.

Figure 1
One dimer of octahedra in the structure of $\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{3}$, showing the atom-numbering scheme and $50 \%$ probability displacement ellipsoids. H atoms have been omitted for clarity.

Received 23 September 2003 Accepted 29 September 2003 Online 7 October 2003

Figure 2
A perspective view of the crystal structure of $\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{3}$ in a polyhedral representation, showing the zigzag chains of edge-connected dimers.

The $\left[\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{5}\right]$ octahedra in $\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{3}$ are connected via two common bromide edges, in accordance with the formulation $\left[\mathrm{Sc}\left(\mathrm{NH}_{3}\right)_{1 / 1} \mathrm{Br}_{1 / 1} \mathrm{Br}_{4 / 2}\right.$ ], to form a zigzag chain (Fig. 1). These chains are arranged as shown in Fig. 2 and they appear to be held together by van der Waals and hydrogen bonding.

## Experimental

Ammonium bromide, $\left(\mathrm{NH}_{4}\right) \mathrm{Br}(5 \mathrm{mmol}, 490 \mathrm{mg})$, and scandium metal ( $2 \mathrm{mmol}, 90 \mathrm{mg}$ ) were placed in a tantalum container, which was then sealed by helium arc welding and jacketed by a silica ampoule. The reaction mixture was heated to 623 K for 100 h . Colourless single crystals of $\mathrm{Sc}\left(\mathrm{NH}_{3}\right) \mathrm{Br}_{3}$ were selected under a microscope in an argon-filled dry box.

| $\mathrm{~N} 2-\mathrm{H} 2 C \cdots \mathrm{Br} 11^{\mathrm{iv}}$ | 0.89 | 2.66 | $3.551(7)$ | 174 |

Symmetry codes: (iii) $-x, 2-y, 2-z$; (iv) $x, 1+y, z$; (v) $1-x, 1-y, 1-z$; (vi) $1+x, y-1, z$.

The H atoms were placed in idealized positions and constrained to ride on their parent atoms, with $\mathrm{N}-\mathrm{H}$ distances of $0.890 \AA$. A common $U_{\text {iso }}(\mathrm{H})$ value was refined for all six H atoms. The highest peak is located $1.30 \AA$ from Br 21 and the deepest hole $0.85 \AA$ from Br2.
