2a,5a-Dichloro-4-methyl-1-methylene-2-phenyl-2a,5a-dihydrocyclobuta[c]-pyrrole-3,5-dione

In the title compound, $\text{C}_{14}\text{H}_{11}\text{Cl}_2\text{NO}_2$, the pyrrolidine ring is planar within $0.050\text{ (3)\text{ \AA}}$ and the cyclobutane ring is planar within $0.059\text{ (3)\text{ \AA}}$. The dihedral angle between these two planes is 67.4 (2)^\circ . The packing of the molecules in the crystal is stabilized by $\text{C}-\text{H}\cdots\pi$ interactions.

Comment

In our recent investigation on photoinduced reactions of 3,4-dichloromaleimide with styrene derivatives (Zhao & Xu, 2003), we carried out a photoinduced reaction of 3,4-dichloromaleimide with phenylpropadiene. The title compound, (I), was obtained in this reaction as one of the two stereoisomers. It is formed by $[2 + 2]$ -cycloaddition of the triplet-excited dichloromaleimide with phenyl propadiene at its central $\text{C}=\text{C}$ bond. An X-ray crystallographic analysis was undertaken to elucidate its molecular conformation.

The bond lengths in (I) are within normal ranges (Allen *et al.*, 1987), except for a long $\text{C}2-\text{C}7$ bond, $1.577\text{ (4)\text{ \AA}}$. This may be due to the steric effect of the bulky substituent attached at atom C7. The pyrrolidinedione moiety is essentially planar, mainly due to $\text{C}=\text{O}$ and $\text{C}-\text{N}$ conjugation. The cyclobutane ring ($\text{C}2/\text{C}3/\text{C}6/\text{C}7$) is planar within $0.059\text{ (3)\text{ \AA}}$; the dihedral angle between the $\text{C}3/\text{C}2/\text{C}7$ and $\text{C}3/\text{C}6/\text{C}7$ planes is 12.2 (4)^\circ . The cyclobutane mean plane makes a dihedral angle of 67.4 (2)^\circ with the fused five-membered ring ($\text{N}1/\text{C}1-\text{C}4$). The phenyl ring ($\text{C}8-\text{C}13$) attached at C7 makes dihedral angles of 71.9 (2) and 9.9 (2)^\circ with the cyclobutane

Figure 1

ring and the pyrrolidine ring, respectively. The C11–C2–C3–C12 torsion angle of 12.7 (3)° indicates that the two Cl atoms lie on the same side of the cyclobutane ring.

In the crystal structure of (I), there is one intramolecular C5–H5C···O2 interaction, forming a five-membered ring (Fig. 1). The molecular packing in the crystal structure is stabilized by C–H··· π interactions involving the methyl group with the phenyl ring of a symmetry-related molecule (Table 2).

Experimental

The title compound, (I), was prepared by photolysis of a benzene solution of 3,4-dichloromaleimide in the presence of an excess amount of propadiene, followed by chromatographic separation of the reaction mixture on a silica-gel column with petroleum ether (b.p. 333–363 K)–ethyl acetate as eluents. Single crystals suitable for X-ray crystallographic analysis were grown by slow evaporation of solvent from petroleum ether (b.p. 333–363 K)–ethyl acetate (3:1 v/v).

Table 2

Hydrogen-bonding geometry (Å, °).

$D\text{--}H\cdots A$	$D\text{--}H$	$H\cdots A$	$D\cdots A$	$D\text{--}H\cdots A$
C5–H5C···O2	0.96	2.49	2.872 (4)	103
C5–H5B···CgP ⁱ	0.96	2.75	3.579 (3)	145

Symmetry code: (i) $\frac{1}{2} + x, y - \frac{1}{2}, z$. CgP denotes the centroid of the phenyl ring.

All H atoms were located in difference Fourier maps and were refined isotropically, except for those attached to the methyl C atom, which were positioned geometrically and treated as riding, with C–H distances of 0.96 Å and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$. The C–H distances of the refined H atoms lie in the range 0.85 (4)–0.97 (4) Å.

Data collection: SMART (Siemens, 1996); cell refinement: SAINT (Siemens, 1996); data reduction: SAINT; program(s) used to solve structure: SHELXTL (Sheldrick, 1997); program(s) used to refine structure: SHELXTL; molecular graphics: SHELXTL; software used to prepare material for publication: SHELXTL, PARST (Nardelli, 1995) and PLATON (Spek, 2003).

The authors thank the Malaysian Government and Universiti Sains Malaysia for research grant R&D No. 305/PFIZIK/610961.
