# A new polymorph of $\mu$ -bis(diphenylphosphino)methane- $\kappa^2 P$ :P'-bis[chlorogold(I)]

The title compound,  $[(AuCl)_2(dppm)]$  (dppm =  $Ph_2P(CH_2)$ - $PPh_2$ ), has been found to crystallize as a new triclinic polymorph. Unlike the previously reported monoclinic form, there are no aurophilic  $Au\cdots Au$  interactions between the Au(I) atoms.

Received 13 October 2003 Accepted 3 November 2003 Online 8 November 2003

#### Comment

The structure of the title compound, (I), was first determined by Schmidbaur *et al.* (1977) [monoclinic, space group C2/c, a = 22.31 (1) Å, b = 7.215 (7) Å, c = 18.12 (1) Å and  $\beta = 120.43$  (8)°]. This structure, (Ia), consists of discrete molecules of [(AuCl)<sub>2</sub>(dppm)] disposed about the crystallographic twofold axis with a conformational structure in which the Au-P···P—Au torsion angle is 67 (1)°, yielding an intramolecular Au···Au distance of 3.351 (2) Å. This distance has subsequently been classified as an intramolecular Au<sup>I</sup>···Au<sup>I</sup> aurophilic interaction, facilitated by the small bite of the dppm ligand (*e.g.* Van Calcar *et al.*, 1997).

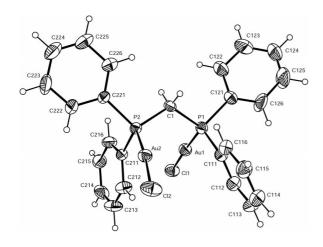

The complex also crystallizes in the triclinic space group  $P\overline{1}$ , as discrete molecules with one complete molecule constituting the asymmetric unit [structure (Ib); Figs. 1 and 2]. The most significant difference between the structures of the two polymorphs is that, in (Ib), there are no  $Au^I \cdots Au^I$  aurophilic interactions. In (Ib), the  $Au-P\cdots P-Au$  torsion angle is 124.3 (1)°, yielding an  $Au1\cdots Au2$  distance of 5.617 (3) Å, while all intermolecular  $Au\cdots Au$  distances are greater than 4 Å. The Au atoms are located above the plane of a phenyl ring on the opposite P atom, suggesting that  $Au\cdots \pi$  interactions may be an important factor in the determination of the conformational structure of this polymorph.

There are no unusual features of the gold coordination geometry of (Ib), with Au-P=2.233 (3) and 2.228 (2) Å, Au-Cl=2.276 (3) and 2.278 (3) Å, and P-Au-Cl=177.4 (1) and 175.5 (1)° [cf. (Ia), Au-P=2.238 (1) Å, Au-Cl=2.288 (1) Å and P-Au-Cl=175.2 (2)°]. The absence of aurophilic interactions in (Ib), however, is consistent with the observed increase in the P-C-P ligand bite angle from 116 (1)° in (Ia) to 119.7 (5)° in (Ib).

#### **Experimental**

(NBu<sub>4</sub>)[AuCl<sub>4</sub>] (29 mg, 0.049 mmol) and bis(diphenylphosphino)-methane (19 mg, 0.049 mmol) were suspended in a solution of concentrated HCl (0.2 ml) in dimethylformamide (5 ml). The mixture was gently warmed to give a clear pale-yellow solution, which quickly faded to give a colorless solution. Cooling this solution to room temperature followed by slow evaporation of the solvent over a period of several days yielded well formed colorless needle-like crystals of (Ib); m.p. 538–541 K. Analysis found: C 35.80, H 2.65%; calculated for  $C_{25}H_{22}Au_2Cl_2P_2$ : C 35.36, H 2.61%.

H atoms were constrained in the riding model approximation, fixed to their parent C atoms at a C—H distance of 0.95 Å, and  $U_{\rm iso}({\rm H})$  values were set to  $1.2 U_{\rm eq}$  of the parent atom. The maximum and minimum residual electron densities were located within 1 Å of atoms Au1 and Au2. The magnitude and anisotropy of the displacement ellipsoids of phenyl rings 12n and 22n (n=1–6) are consistent with a measure of disorder in these rings.
