**Key indicators**

Single-crystal X-ray study

T = 295 K

Mean  $\sigma(\text{C}-\text{C}) = 0.005 \text{ \AA}$ 

Disorder in main residue

R factor = 0.054

wR factor = 0.154

Data-to-parameter ratio = 10.9

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

Crystals of the title molecular complex,  $\text{C}_8\text{H}_8\text{O}_3 \cdot \text{C}_3\text{H}_7\text{NO}_2$ , were obtained from the remaining filtrate after separating the crystals of a molecular complex of (*S*)-alanine–(*R*)-mandelic acid in an optical resolution experiment using (*S*)-alanine. Each (*S*)-alanine is hydrogen bonded to three (*S*)-mandelic acid molecules (and *vice versa*). The carboxylate of (*S*)-alanine is nearly coplanar with the carboxyl group of (*S*)-mandelic acid, a situation that is very different from that found in the reported (*S*)-alanine–(*R*)-mandelic acid.

**Comment**

In the investigation of the optical resolution of racemic mandelic acid by (*S*)-alanine, crystals of the molecular complex of (*S*)-alanine and (*R*)-mandelic acid [(*S*)A/(*R*)M] were obtained from the solution of racemic mandelic acid and (*S*)-alanine, and the crystal structure has been reported (Hu *et al.*, 2002). After several days separating the (*S*)A/(*R*)M crystals from the solution, new crystals appeared in the remaining filtrate. An X-ray structure analysis revealed that the new crystals are (*S*)-alanine–(*S*)-mandelic acid (1/1) [(*S*)A/(*S*)M], (I), a diastereomer of (*S*)A/(*R*)M. We present here the structure of (I), for comparison with the reported (*S*)A/(*R*)M.

The title molecular complex consists of (*S*)-alanine and (*S*)-mandelic acid in a 1:1 ratio. The ordered (*S*)-alanine displays the normal inner-salt structure (Table 1) and links with three neighboring (*S*)-mandelic acid molecules *via*  $\text{N}-\text{H} \cdots \text{O}$  and  $\text{O} \cdots \text{H}-\text{O}$  hydrogen bonds (Table 2). The phenyl ring of (*S*)-mandelic acid is disordered, three different orientations being observed in the crystal (Fig. 1); this is due to the space around the phenyl group, as shown in the molecular packing diagram (Fig. 2).

There are several distinct structural differences between (I) and the reported (*S*)A/(*R*)M. The asymmetric unit contains one (*S*)-alanine and one (*S*)-mandelic acid molecule in (I), but two (*S*)-alanine, two (*R*)-mandelic acid and one water molecule in (*S*)A/(*R*)M, which is a hydrate. Strong hydrogen bonding occurs between the carboxylate group of alanine and the carboxyl group of mandelic acid in both (I) and (*S*)A/(*R*)M, the  $\text{O} \cdots \text{O}$  separation being 2.461 (4) Å in (I), and 2.494 (3) and 2.554 (3) Å in (*S*)A/(*R*)M. The  $\text{O}-\text{H}$  bond of the carboxyl group is *anti* to the  $\text{C}=\text{O}$  bond in (I), but *syn* to the  $\text{C}=\text{O}$  bond in (*S*)A/(*R*)M. The carboxylate plane is

**Figure 1**

The structure of (I), with 30% probability displacement ellipsoids, the dashed lines showing the hydrogen bond between (*S*)-alanine and (*S*)-mandelic acid [symmetry codes: (ii)  $1-x, y, -z$ ; (iii)  $x-\frac{1}{2}, \frac{1}{2}+y, z$ ]. Three components of the disordered mandelic acid molecule are illustrated.

**Figure 2**

A molecular packing diagram, showing the intermolecular hydrogen bonding (as dashed lines) and the space around the phenyl ring.

roughly coplanar with the carboxyl plane in (I), the dihedral angle being  $26.4(3)^\circ$ , but in (*S*)A/(*R*)M they are nearly perpendicular to each other, the dihedral angles being  $56.8(3)$  and  $59.6(3)^\circ$ , respectively, for the two independent molecules.

## Experimental

Racemic mandelic acid (1.5 g, 10 mmol) and (*S*)-alanine (0.90 g, 10 mmol) were dissolved in hot water (10 ml) and the solution was kept at room temperature. After 2 d, crystals (0.85 g) of (*S*)A/

(*R*)M·H<sub>2</sub>O were separated from the solution (Hu *et al.*, 2002). The remaining filtrate was kept at room temperature to obtain more crystals. The fine crystals of the title compound (0.45 g) were obtained from the remaining filtrate after a further 3 d. The CHN content was analyzed using an Eager 200 elemental analysis instrument. Analysis calculated for C<sub>11</sub>H<sub>15</sub>NO<sub>5</sub>: C 54.8, H 6.3, N 5.8%; found: C 54.7, H 6.3, N 5.9%. The specific optical rotation  $[\alpha]_D$  of  $+80.2^\circ$  (H<sub>2</sub>O) was determined using a Wzz-1S instrument. Recrystallization from an aqueous solution was performed to obtain well shaped single crystals of the title compound.

Three different orientations for the phenyl ring were found in a difference Fourier map. Isotropic rigid-group refinement for the phenyl rings was performed. The three occupancies were initially refined and then fixed in the final cycles of refinement. H atoms on the N atom were located in a difference Fourier map, then refined as a group with N—H = 0.89 Å and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{N})$ . Other H atoms

were placed in calculated positions, with C–H = 0.93–0.98 Å and O–H = 0.82 Å, and treated as riding, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$  or  $1.5U_{\text{eq}}$  of the carrier atoms. The absolute configuration was assigned on the basis of the *S* configuration of the starting (*S*)-alanine and was not determined directly from the X-ray data; Friedel pairs were averaged.

Data collection: *MSC/AFD Diffractometer Control Software* (Molecular Structure Corporation, 1992); cell refinement: *MSC/AFD Diffractometer Control Software*; data reduction: *TEXSAN* (Molecular Structure Corporation, 1985); program(s) used to solve structure: *SIR-2* (Altomare *et al.*, 1993); program(s) used to refine structure: *SHELXL97* (Sheldrick, 1997); molecular graphics: *ORTEP-3 for Windows* (Farrugia, 1997); software used to prepare material for publication: *WinGX* (Farrugia, 1999).
