## $\mu$-Terephthalato-bis[aquachloro(1,10phenanthroline)copper(II)]

In the centrosymmetric title compound, $\left[\mathrm{Cu}_{2}\left(\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{4}\right)\right.$ $\mathrm{Cl}_{2}\left(\mathrm{C}_{12} \mathrm{H}_{8} \mathrm{~N}_{2}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}$ ], each Cu atom is surrounded by an O atom from a terephthalate dianion, a water molecule, a Cl atom and the N atoms from a 1,10-phenanthroline heterocycle in an octahedral arrangement. The terephthalate dianion, which functions as a bridge between two Cu atoms, lies on a special position of $\overline{1}$ site symmetry.

## Comment

Among the metal complexes of terephthalic acid (Fun et al., 1999; Li et al., 1998; Mori \& Takamizawa, 2000), the copperphenanthroline (phen) system has been well studied; the compounds structurally documented include, for example, dimeric $\left[\mathrm{Cu}_{2}\left(\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{4}\right)(\text { phen })_{4}\right]\left(\mathrm{ClO}_{4}\right)_{2}$ and three polymeric complexes, viz. $\left[\mathrm{Cu}\left(\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{4}\right)(\right.$ phen $\left.)\right],\left[\mathrm{Cu}\left(\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{4}\right)\right.$ (phen)$\left.\left(\mathrm{H}_{2} \mathrm{O}\right)\right]$ and $\left[\mathrm{Cu}\left(\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{4}\right)(\right.$ phen $\left.)\left(\mathrm{H}_{2} \mathrm{O}\right)\right]\left(\mathrm{H}_{2} \mathrm{O}\right)\left(\mathrm{C}_{3} \mathrm{H}_{7} \mathrm{ON}\right)$ (Sun et al., 2000, 2001; Zhu et al., 2004). In our previous work, we obtained a chain polymer with both terephthalate dianion and chloro bridges, viz. $\left.\left[\mathrm{Cu}_{2} \mathrm{Cl}_{2} \text { (nphen) }\right)_{2}\left(\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{4}\right)\right] \cdot 2 \mathrm{C}_{3} \mathrm{H}_{7} \mathrm{ON}$, where nphen is replaced by 5-nitro-1,10-phenanthroline (nphen) (Xiao \& Zhu, 2003). In the present compound, (I), the Cu atom is linked to four different ligands.

(I)

In centrosymmetric (I), the Cu atom is surrounded by an O atom from a terephthalate dianion, a water molecule, a Cl atom and the N atoms from a 1,10-phenanthroline heterocycle in an octahedral arrangement. The terephthalate dianion, which functions as a bridge between two Cu atoms, lies on a special position of $\overline{1}$ site symmetry. The $\mathrm{Cu} 1-\mathrm{O} 1$ bond length [1.9455 (15) $\AA$ ] is in agreement with analogous literature distances in copper complexes containing a bis-monodentate terephthalate ligand (Cano et al., 1997; Deakin et al., 1999; Li

Figure 1
The structure of (I), with the atom numbering of the asymmetric unit, showing displacement ellipsoids at the $50 \%$ probability level.

Received 22 January 2004 Accepted 27 January 2004 Online 7 February 2004

Zigzag chains formed by hydrogen-bonding interactions, which are shown as dashed lines. H atoms have been omitted.
et al., 2001; Xanthopoulos et al., 1993). The aromatic rings of the terephthalate and phen ligands are almostly coplanar, the dihedral angle being only $5.90(6)^{\circ}$. The $\mathrm{Cu} \cdots \mathrm{Cu}$ distance [11.13 (6) Å] through the bridging terephthalate ligand is also in agreement with that reported for bis-monodentate tereph-thalate-bridged copper(II) complexes (Cano et al., 1997; Sun et al., 2000, 2001). There is one intramolecular hydrogen bond ( $\mathrm{O} 3-\mathrm{H} 3 \cdots \mathrm{O} 2$ ) and also one intermolecular hydrogen bond $\left[\mathrm{O} 3-\mathrm{H} 3 \mathrm{~B} \cdots \mathrm{Cl}^{\mathrm{i}}\right.$; symmetry code: (i) $\left.1-x, 1-y,-z\right]$, resulting in the formation of zigzag chains (Fig. 2).

## Experimental

A solution ( 10 ml ) of dimethylformamide containing $\mathrm{CoCl}_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ $(0.5 \mathrm{mmol}, 0.12 \mathrm{~g}), \mathrm{CuCl}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}(0.5 \mathrm{mmol}, 0.09 \mathrm{~g})$ and terephthalic acid $(0.5 \mathrm{mmol}, 0.08 \mathrm{~g})$ was added slowly to a solution ( 10 ml ) of dimethylformamide containing 1,10-phenanthroline ( 0.5 mmol , 0.10 g ). The mixture was stirred for 30 min and left to stand at room temperature for about a month, after which time green prismatic crystals were obtained.
