CommentThe primary amino group in the ligand *N*-(8-quinolyl)-*o*-phenyldiamine can undergo several substitution reactions and a variety of Schiff base derivatives can be prepared to obtain hitherto unknown hexa- and octadentate ligands which provide access to multinuclear metal complexes.

In the present study, we report the crystal structure of the title compound, (I), containing a highly basic tetramethylguanidine group, namely *N*-(8-quinolyl)-*o*-(1,1,3,3-tetramethylguanidino)phenylamine. The molecular structure (Fig. 1) displays the orientation of the quinolyl plane relative to the substituted phenyl ring. The angle between planes $\text{N}3/\text{C}1-\text{C}9$ and $\text{C}10-\text{C}15$ is 31.61 (5) $^\circ$ and the torsion angle $\text{C}9-\text{N}2-\text{C}10-\text{C}11$ is -17.3 (2) $^\circ$. The $\text{C}-\text{N}-\text{C}$ angle at the sp^3 atom $\text{N}2$ is enlarged to 129.9 (1) $^\circ$ and the two $\text{C}-\text{N}$ bond lengths are similar [$\text{C}9-\text{N}2 = 1.375$ (2) Å and $\text{C}10-\text{N}2 = 1.395$ (2) Å]. The $\text{C}16=\text{N}1$ double bond measures 1.303 (2) Å, and the torsion angle $\text{C}16-\text{N}1-\text{C}15-\text{C}10$ between the guanidine moiety and the attached phenyl ring is -141.5 (1) $^\circ$. This molecular geometry is accompanied by two intramolecular hydrogen bonds [$\text{N}2-\text{H}2\cdots\text{N}1$ with $\text{H}\cdots\text{N} = 2.17$ Å and $\text{N}-\text{H}\cdots\text{N} = 106^\circ$, and $\text{N}2-\text{H}2\cdots\text{N}3$ with $\text{H}\cdots\text{N} =$

2.25 Å and $N-H \cdots H = 103^\circ$]. The shortest non-bonding intermolecular contact is $C4-H4A \cdots N1(1-x, y-\frac{1}{2}, \frac{1}{2}-z)$ with $H \cdots N = 2.52$ Å. (These values have been normalized for $N-H = 1.03$ Å and $C-H = 1.08$ Å, whereas those in Table 2 are uncorrected.) Fig. 2 shows the crystal packing of (I).

Studies are now in progress to examine the coordination properties of this ligand.

Experimental

Compound (I) was prepared by transformation of the primary amine functionality in its precursor into guanidine by reacting it with Vilsmeier salt $[(Me_2N)_2CCl]Cl$, which, in turn, was obtained by the reaction of tetramethylurea with phosgene (Kantlehner *et al.*, 1984). The free base was obtained by deprotonation of the resulting hydrochloride using a two-phase system of MeCN/50% aqueous KOH. Suitable crystals were obtained by slow evaporation of a saturated solution in acetonitrile. 1H NMR (500 MHz, $CDCl_3$, δ): 8.66 (*d*, 1H, $J = 1.5, 4.1$ Hz), 8.56 (*s*, 1H), 7.93 (*d*, $J = 1.6, 7.3$ Hz), 7.51–7.43 (*m*, 1H), 7.43 (*d*, 1H, 12 Hz), 7.30–7.23 (*m*, 2H), 7.03 (*d*, 1H, 8 Hz), 6.83–6.78 (*m*, 2H), 6.63–6.58 (*m*, 1H), 2.56 (*s*, 12H). IR (KBr, ν [cm^{-1}]): 3317 (*m*), 3032 (*w*), 3920 (*w*), 2920 (*w*), 2885 (*w*), 1607 (*m*), 1580 (*s*), 1562 (*s*), 1513 (*s*), 1375 (*ms*), 1148 (*m*), 1022 (*ms*), 815 (*m*), 740 (*m*).
