## Tetrakis[(4-phenylpiperazin-1-yl)methyl]methane

The title compound, $\mathrm{C}_{45} \mathrm{H}_{60} \mathrm{~N}_{8}$, is a symmetric molecule with four chemically identical substituents bonded to a central C atom. In the crystal structure, the 4-phenylpiperazin-1-yl groups exhibit four different conformations, with no obvious pseudosymmetry.

## Comment

It has been reported that many molecules can crystallize with $Z^{\prime}>1$, the crystal structures containing several molecules in the asymmetric unit (Brock \& Duncan, 1994; Lehmler et al., 2002; Kuleshova et al., 2003; Bats et al., 2003; Lu et al., 2003). Previous reports indicate that the same molecules can exist in different conformations without obvious pseudosymmetry. Logically the following question may arise: can identical substituents of a molecule exhibit different conformations in the solid state? To answer such a question, we are focusing our work on the structures of molecules containing chemically identical substituents.

(1)

The title compound, (I), is a dendrimer with a central C atom bearing four (4-phenylpiperazin $-1-\mathrm{yl}$ )methyl groups. The molecular structure of (I), with the atom-labeling scheme, is shown in Fig. 1. Selected bond and torsion angles are given in Table 1. In the crystal structure, there are some short intermolecular $\mathrm{C}-\mathrm{H} \cdots \mathrm{C}$ interactions (see Table 2) and a $\mathrm{C}-$ $\mathrm{H} \cdots \pi$ interaction involving $\mathrm{C} 8-\mathrm{H} 8$ and the $\mathrm{C} 40^{\mathrm{i}}-\mathrm{C} 45^{\mathrm{i}}$ ring; the $\mathrm{H} 8 \cdots$ centroid distance is $2.77 \AA$ and the $\mathrm{C} 8-\mathrm{H} 8 \cdots$ centroid angle is $127^{\circ}$ [symmetry code: (i) $1-x,-y, 1-z$ ].

The bond angles $\mathrm{C} 1-\mathrm{C} 2-\mathrm{N} 1, \mathrm{C} 1-\mathrm{C} 13-\mathrm{N} 3$ and $\mathrm{C} 1-$ C24-N5 are slightly different [115.1 (2), 116.5 (2) and 114.1 (2) ${ }^{\circ}$, respectively], whereas bond angles $\mathrm{C} 1-\mathrm{C} 35-\mathrm{N} 7$ and $\mathrm{C} 1-\mathrm{C} 2-\mathrm{N} 1$ are the same $\left[115.2(2)\right.$ and $115.1(2)^{\circ}$,

respectively]. However, bond angle $\mathrm{C} 37-\mathrm{N} 8-\mathrm{C} 38$ [112.2 (2) ${ }^{\circ}$ ] is larger than $\mathrm{C} 4-\mathrm{N} 2-\mathrm{C} 5$ [110.8 (2) ${ }^{\circ}$ ]. This implies that the structural parameters of the four substituents are not strictly equal.

The torsion angles about bonds $\mathrm{C} 2-\mathrm{N} 1, \mathrm{C} 13-\mathrm{N} 3, \mathrm{C} 24-$ N5 and C35-N7 are given in Table 1 and show them to be different. It should be noted that the differences between any two corresponding torsion angles are far larger than their uncertainties. Table 1 also presents some selected torsion angles involving non-bonding atoms. The corresponding torsion angles $\mathrm{C} 1-\mathrm{C} 2-\mathrm{N} 1 \cdots \mathrm{~N} 2, \mathrm{C} 1-\mathrm{C} 13-\mathrm{N} 3 \cdots \mathrm{~N} 4, \mathrm{C} 1-$ $\mathrm{C} 24-\mathrm{N} 5 \cdots \mathrm{~N} 6$ and $\mathrm{C} 1-\mathrm{C} 35-\mathrm{N} 7 \cdots \mathrm{~N} 8$ are different from each other. Furthermore, the different twists between the phenyl group and the piperazine ring are distinguishable, indicating that the four 4-phenylpiperazin-1-yl groups exist in four different conformations.

This comprehensive analysis suggests that the four chemically identical substituents are different in the solid state. Similar features have also been seen in the $Z^{\prime}=4$ crystal structure of bis(4-phenylpiperazin-1-yl)methane ( Lu et al., 2003), where 4-phenylpiperazin-1-yl groups actually exhibit eight different conformations.

## Experimental

Compound (I) was synthesized by reacting pentaerythrityl bromide, $\mathrm{Na}_{2} \mathrm{CO}_{3}$ and 1-phenylpiperazine [which was prepared in situ by a modification of the literature method of Garrard \& Partridge (1993)], in dry DMF at 333 K for 12 h . Work-up gave the desired product (yield 86.5\%), which was purified by recrystallization from DMF to obtain white crystals of (I) (m.p. 447-449 K). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $500 \mathrm{MHz}): \delta 2.56(s, 8 \mathrm{H}), 2.72(s, 16 \mathrm{H}), 3.17(s, 16 \mathrm{H}), 6.83-7.28(m$, $20 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 500 \mathrm{MHz}\right): \delta 49.5,50.7,56.1,62.8,115.7$, 119.4, 129.0, 151.3; IR (KBr) v: 2954, 2794, 1600, 1502, 1457, 1382, 1236, 1010, $925,754,687 \mathrm{~cm}^{-1}$.
