## Comment

The coordination chemistry of divalent mercury with  $N$ -donor ligands has been reviewed several times (*e.g.* Grdenić, 1965; Breitingner & Brodersen, 1970). In a systematic structural study, we have used diazines as  $N$ -donor ligands to mercuric halides (Nockemann, 2002; Meyer & Nockemann, 2003).

The structure of  $[\text{Hg}_2\text{I}_4(\text{Pyp})]$ , (I), consists of two  $\text{HgI}_2$  molecules, which are connected by the 1 and 4 positions of a pyrazine molecule. The complete discrete molecule is centrosymmetric. The  $\text{Hg}-\text{N}$  bond length [ $2.511(18)\text{ \AA}$ ] is shorter than in the adduct of pyrazine with mercuric bromide  $\text{HgBr}_2$  (Nockemann & Meyer, 2004*b*), indicating somewhat stronger covalent contributions. This affects also the  $\text{I}-\text{Hg}-\text{I}$  angle, which is bent to  $163.41(7)^\circ$ , smaller than that of the bromide at  $167.78(3)^\circ$ . The  $\text{Hg}-\text{I}$  bond lengths are  $2.6036(19)$  and  $2.6278(19)\text{ \AA}$ , comparable to those in mercury(II) iodide itself in its metastable orange modification, at  $2.612\text{ \AA}$  (Jeffrey & Vlasse, 1967), but shorter than in the

room-temperature modification, at 2.784 Å (Turner & Harmon, 1989).

There are no significant interactions between the molecules in the crystal structure. Thus, a molecular compound with a 2:1 ratio of  $\text{HgI}_2$  to pyrazine is formed, even though the synthesis employed a large excess of pyrazine. The series of adducts of pyrazine with  $\text{HgCl}_2$ ,  $\text{HgBr}_2$  and  $\text{HgI}_2$  exhibits a tendency to depolymerization in this order (Nockemann & Meyer, 2004a,b).

## Experimental

$[\text{Hg}_2\text{I}_4(\text{Pyp})]$  was obtained by adding a solution of an excess of pyrazine (2.0 g, 25 mmol) in ethanol to an ethanolic solution of mercury(II) iodide (2.27 g, 5 mmol) in a Schlenk vessel under an argon atmosphere. Yellow crystals were obtained by slow evaporation of the ethanol into a second vessel, cooled with dry ice. Exposure of the crystals to moist air results in their decomposition after a few hours.
