Key indicators

Single-crystal X-ray study

$T = 293\text{ K}$

Mean $\sigma(\text{C–C}) = 0.003\text{ \AA}$

R factor = 0.040

wR factor = 0.045

Data-to-parameter ratio = 14.0

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

The title compound, $\text{C}_{13}\text{H}_7\text{N}_3\text{O}$, contains a phthalonitrile ring and a pyridine ring which are not coplanar, but form a dihedral angle of $85.77(13)^\circ$.

Comment

Phthalocyanines are of enormous technological importance for the manufacture of blue and green pigments. Other areas of current interest include applications in catalysis, chemical sensors, electrochromism, batteries, photodynamic therapy, semiconductive materials, liquid crystals and modified supports for gas–solid chromatography (Leznoff & Lever, 1989–1996). Tetrasubstituted phthalocyanines are generally obtained from mono-substituted phthalonitriles such as 4-(3-pyridyloxy)phthalonitrile (McKeown, 1998), (I), the structure of which is reported here.

The molecule is non-planar, the dihedral angle between the two six-membered rings being $85.77(13)^\circ$. Bond distances and angles are unexceptional.

Experimental

3-Pyridinol (0.60 g, 6.31 mmol) and 4-nitrophthalonitrile (1.00 g, 5.78 mmol) were dissolved in dry dimethyl sulfoxide (40 ml) with stirring under N_2 . Dry fine-powdered potassium carbonate (1.0 g, 7.24 mmol) was added in portions (10×1 mmol) every 10 min. The reaction mixture was stirred for 48 h at room temperature and poured into ice–water (150 g). The product was filtered off and washed with (10% *w/w*) NaOH solution and water until the filtrate was neutral. Recrystallization from ethanol solution gave a white product (yield 0.73 g, 57.03%). Single crystals were obtained from an absolute ethanol solution of the compound *via* slow evaporation at room temperature (m.p. 384 K).
