#### Key indicators

Single-crystal X-ray study

$T = 293\text{ K}$

Mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$

$R$  factor = 0.038

$wR$  factor = 0.111

Data-to-parameter ratio = 19.0

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

## 4-(3,5-Dimethoxyphenoxy)phthalonitrile

The crystal structure of the title compound,  $\text{C}_{16}\text{H}_{12}\text{N}_2\text{O}_3$ , is composed of a 3,5-dimethoxyphenoxy group attached to a phthalonitrile group. The structure is stabilized by intermolecular  $\text{C}-\text{H}\cdots\text{N}$  contacts, in addition to weak van der Waals interactions.

#### Comment

Monosubstituted phthalonitriles, such as 4-(3,5-dimethoxyphenoxy)phthalonitrile, (I), are generally used for the synthesis of symmetrically and unsymmetrically substituted phthalocyanines and subphthalocyanines (Leznoff & Lever, 1989–1996). Phthalocyanines have continuously been the subject of research due to their wide-ranging applications, such as in organic pigments, chemical sensors, electrochromic display devices, photovoltaic cells, xerography, optical disks, catalysis and non-linear optics (McKeown, 1998).

Fig. 1 shows a perspective view of the molecule of (I), with the atom-numbering scheme. The triple-bond distance in the cyano groups is in good agreement with our previous reports (Köysal *et al.*, 2003; Köysal *et al.*, 2004; Ocak *et al.*, 2003).

Atoms  $\text{C}9/\text{C}10/\text{C}11/\text{C}12/\text{C}13/\text{C}14$  are coplanar, with a maximum deviation of 0.17 (14) Å for atom  $\text{C}12$ ; atoms  $\text{O}2$  and  $\text{O}3$  are 0.0022 (12) and 0.0082 (10) Å, respectively, from this plane. The dihedral angle between the  $\text{C}9-\text{C}14$  and  $\text{C}1-\text{C}6$  rings is 59.33 (4)°.

The crystal structure has an intermolecular  $\text{C}-\text{H}\cdots\text{N}$  hydrogen bond,  $\text{C}2-\text{H}2\cdots\text{N}2^i$  [symmetry code: (i)  $x, -y - \frac{1}{2}, z$ ].

**Figure 1**

The structure of the title compound, (I), showing 50% probability displacement ellipsoids and the atom-numbering scheme.

$\frac{1}{2} + z$ ]. In the crystal packing, the 3,5-dimethoxyphenoxy groups are close to each other, with van der Waals interactions, and are stacked parallel to the *c* axis of the unit cell.

## Experimental

3,5-Dimethoxyphenol (1.08 g, 7 mmol) and 4-nitrophthalonitrile (1.00 g, 5.78 mmol) were dissolved in dry DMF (40 ml) with stirring under N<sub>2</sub>. Dry fine-powdered sodium carbonate (1.0 g, 7.24 mmol) was added in portions (10 × 1 mmol) every 10 min. The reaction mixture was stirred for 48 h at room temperature and poured into iced water (150 g). The product was filtered off and washed with (10% w/w) NaOH solution and water until the filtrate was neutral. Recrystallization from ethanol gave a white product (yield 1.20 g, 74.07%). Single crystals were obtained from absolute ethanol at room temperature *via* slow evaporation (m.p. 413 K). Analysis calculated for C<sub>16</sub>H<sub>12</sub>N<sub>2</sub>O<sub>3</sub>: C 68.57, H 4.32, N 10.00%; found: C 68.46, H 4.40, N 9.90%. IR data ( $\nu_{\max}/\text{cm}^{-1}$ ): 3056–3022 (Ar-CH<sub>2</sub>), 2960–2856 (CH<sub>2</sub>), 2229 (CN).
