## Diaquabis( $N, N$-dimethylethylenediamine- $\kappa^{2} N, N^{\prime}$ )copper(II) squarate

The crystal structure determination of the title compound, $\left[\mathrm{Cu}\left(\mathrm{C}_{4} \mathrm{H}_{12} \mathrm{~N}_{2}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]\left(\mathrm{C}_{4} \mathrm{O}_{4}\right)$, is reported. It adopts an elongated octahedral trans- $\left[\mathrm{CuN}_{4} \mathrm{O}_{2}\right]$ coordination geometry with the $\mathrm{Cu}^{\mathrm{II}}$ atom located at a centre of symmetry. The axial $\mathrm{Cu}-\mathrm{O}$ bond length is $2.6066(17) \AA$, while the equatorial $\mathrm{Cu}-\mathrm{N}$ bond lengths are 1.9849 (16) and 2.1102 (16) $\AA$. Intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds are responsible for linking the complex cation to the squarate dianion, forming layers. The anion is also centrosymmetric.

## Comment

Copper(II) complexes having ethylenediamine derivatives have potential applications especially in developing photocontrolling materials such as hybrid materials (Choy et al., 2002), photochromism (Takahashi et al., 2002), and thermochromism (Narayanan \& Bhadbhade, 1998). The structure of a number of semi-coordinated $\mathrm{Cu}^{\mathrm{II}}$ complexes with $N$-substituted ethylenediamine ligands have been systematically investigated: $N$-ethylethylenediamine ( $N$-eten; Grenthe et al., 1979), ethylenediamine (en; Maxcy \& Turnbull, 1999), $N$ methylethylenediamine ( $N$-Meen; Akitsu \& Einaga, 2003), $N, N$-dimethylethylenediamine ( $N$ - $\mathrm{Me}_{2} \mathrm{en}$; Akitsu \& Einaga, 2004a; Içbudak et al., 2003) and $N, N^{\prime}$-dimethylethylenediamine ( $N^{\prime}-\mathrm{Me}_{2} \mathrm{en}$; Akitsu \& Einaga, 2004b; Içbudak et al., 2003). As part of our ongoing research on squaric acid $\left(\mathrm{H}_{2} \mathrm{Sq}\right)$ and its mixed-ligand metal complexes (Uçar et al., 2004; Yesilel et al., 2004), the title compound, (I), has been synthesized and its crystal structure (Fig. 1) is reported.

The crystal structure consists of a complex cation and a squarate dianion. The title complex adopts an elongated octahedral trans- $\left[\mathrm{CuN}_{4} \mathrm{O}_{2}\right]$ coordination geometry, in which atom Cu 1 is located at a centre of symmetry. The axial $\mathrm{Cu} 1-$ O1 semi-coordination bond distance is $2.6066(17) \AA$ (the semi-coordination bond range is $2.22-2.89 \AA$ for $\mathrm{H}_{2} \mathrm{O}$; Hath-

away, 1973). The corresponding $\mathrm{Cu}-\mathrm{O}$ bond lengths for the en, N -Meen, N -Eten and N -Me $\mathrm{Me}_{2}$ en complexes are 2.579 (4), 2.569 (2), 2.594 (3) and 2.605 (4) Å, respectively (Akitsu \& Einaga, 2003; Grenthe et al., 1979; Akitsu \& Einaga, 2004a; Içbudak et al., 2003; Maxcy \& Turnbull, 1999). The Cu $\mathrm{N} 1\left(\mathrm{NH}_{2}\right)$ and $\mathrm{Cu} 1-\mathrm{N} 2\left(\mathrm{NMe}_{2}\right)$ bond distances in the title complex are 1.9849 (16) and 2.1102 (16) $\AA$, respectively. These $\mathrm{Cu}-\mathrm{N}$ bond lengths are found to be almost the same as in $\mathrm{Cu}^{\text {II }}$ complexes with $N, N$-dimethylethylenediamine and $N, N^{\prime}$ dimethylethylenediamine ligands (Akitsu \& Einaga, 2004b; Içbudak et al., 2003). The corresponding $\mathrm{Cu}-\mathrm{N}\left(\mathrm{NH}_{2}\right)$ bond
distances were found to be 2.012 (2) and 2.019 (2) $\AA$ for the en, 2,004(2) $\AA$ for the $N$-Meen and 2.013 (3) $\AA$ for the $N$-Eten complexes (Maxcy \& Turnbull, 1999; Akitsu \& Einaga, 2003). The difference in the $\mathrm{Cu}-\mathrm{N}$ bond lengths observed in the title complex may be attributed to the steric hindrance of the methyl groups. The $\mathrm{N} 1-\mathrm{Cu} 1-\mathrm{N} 2$ bond angle of the chelate ligand is $85.02(6)^{\circ}$, slightly larger than that of the $N$-Meen complex $\left[84.58(7)^{\circ}\right]$. The $\mathrm{N} 1-\mathrm{C} 1-\mathrm{C} 2-\mathrm{N} 2$ torsion angle [49.8 (3) ${ }^{\circ}$ ] is found to be almost the same as in the related study of copper(II) complexes having ethylenediamine derivatives (Içbudak et al., 2003; Akitsu \& Komorita, 2002).

The crystal packing of the title complex is illustrated in Fig. 2. $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds are formed between the complex cation and the squarate dianion (Table 2). Each centrosymmetric squarate dianion links four centrosymmetric $\left[\mathrm{Cu}\left(N-\mathrm{Me}_{2} \mathrm{en}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{2+}$ cations to each other via hydrogen bonds. These hydrogen bonds are responsible for linking the ions into layers which lie parallel to the $a b$ plane (Fig. 2).

## Experimental

Squaric acid ( $\mathrm{H}_{2} \mathrm{Sq} ; 0.57 \mathrm{~g}, 5 \mathrm{mmol}$ ) dissolved in 25 ml water was neutralized with $\mathrm{NaOH}(0.40 \mathrm{~g}, 10 \mathrm{mmol})$ and added to a hot solution of copper(II) chloride dihydrate ( $0.853 \mathrm{~g}, 5 \mathrm{mmol}$ ) dissolved in 50 ml water. The mixture was refluxed at 353 K for 12 h and then cooled to room temperature. The green crystals which formed were filtered off and washed with water and methanol, and dried in a vacuum. A solution of $N, N$-dimethylethylenediamine $(0.176 \mathrm{~g}, 2 \mathrm{mmol})$ in water ( 50 ml ) was added dropwise with stirring to a suspension of $\mathrm{CuSq} \cdot 2 \mathrm{H}_{2} \mathrm{O}(0.212 \mathrm{~g}, 1 \mathrm{mmol})$ in water ( 50 ml ). The mixture was stirred at 323 K for 12 h and then cooled to room temperature. After a few days, well formed crystals were selected for X-ray studies.

H atoms attached to C atoms were placed at calculated positions ( $\mathrm{C}-\mathrm{H}=0.96-0.97 \AA$ ) and were allowed to ride on the parent atom $\left[U_{\text {iso }}\left(\mathrm{H}_{\text {methyl }}\right)=1.5 U_{\text {eq }}(\mathrm{C})\right.$ and $\left.U_{\text {iso }}\left(\mathrm{H}_{\text {methylene }}\right)=1.2 U_{\text {eq }}(\mathrm{C})\right]$. The other H atoms were located in a difference map and were refined with the $\mathrm{N}-\mathrm{H}$ and $\mathrm{O}-\mathrm{H}$ distances restrained to be 0.87 (2) and 0.85 (2) $\AA$, respectively.

Data collection: X-AREA (Stoe \& Cie, 2002); cell refinement: $X$-AREA; data reduction: $X$-RED32 (Stoe \& Cie, 2002); program(s)
used to solve structure: SIR97 (Altomare et al., 1999); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: ORTEPIII (Burnett \& Johnson, 1996); software used to prepare material for publication: WinGX (Farrugia, 1999).
