## Key indicators

Single-crystal X-ray study
$T=293 \mathrm{~K}$
Mean $\sigma(\mathrm{C}-\mathrm{C})=0.006 \AA$
Disorder in solvent or counterion
$R$ factor $=0.050$
$w R$ factor $=0.124$
Data-to-parameter ratio $=15.7$
For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

## Bis(ethylenediammonium) tetra- $\mu$-oxotetrakis[(nitrilotriacetato)titanate(IV)] monohydrate

The asymmetric unit of the title compound, $\left(\mathrm{C}_{2} \mathrm{H}_{10} \mathrm{~N}_{2}\right)_{2}\left[\mathrm{Ti}_{4} \mathrm{O}_{4}-\right.$ $\left.\left(\mathrm{C}_{6} \mathrm{H}_{6} \mathrm{NO}_{6}\right)_{4}\right]$, consists of halves of two centrosymmetric tetrameric $\left[\mathrm{Ti}_{4} \mathrm{O}_{4}\left\{\mathrm{~N}\left(\mathrm{CH}_{2} \mathrm{COO}\right)_{3}\right\}_{4}\right]^{4-}$ anions, two $\left[\mathrm{H}_{3} \mathrm{~N}-\right.$ $\left.\left(\mathrm{CH}_{2}\right)_{2} \mathrm{NH}_{3}\right]^{2+}$ cations and a disordered molecule of water of crystallization. In the $\left[\mathrm{Ti}_{4} \mathrm{O}_{4}\left\{\mathrm{~N}\left(\mathrm{CH}_{2} \mathrm{COO}\right)_{3}\right\}_{4}\right]^{4-}$ tetramer, each Ti atom is coordinated by one nitrilotriacetate ligand and two $\mu$-oxo ligands, so that four titanium and four $\mu$ - O atoms form an eight-membered ring. The tetramers are connected by hydrogen bonds with $\left[\mathrm{H}_{3} \mathrm{~N}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{NH}_{3}\right]^{2+}$ cations and with water molecules, leading to an intricate three-dimensional network.

## Comment

Titanium nitrilotriacetate complexes are considered to be a precursor of Schwarzenbach's peroxo complexes (Wieghardt et al., 1980), but the synthesis of these complexes has not been highly developed as a result, in large part, of the strong tendency of group 4 complexes toward hydrolysis and polymerization reactions even in strong acid media (Cotton \& Wilkinson, 1988; Intorre \& Martell, 1960). The existence of titanium nitrilotriacetate complexes has been documented, but relatively few complexes of this type have been characterized (Wieghardt et al., 1980; Schwarchzenbach \& Girgis, 1975). All contain a tetrameric titanate anion and an inorganic cation, and this is the first time that the crystal structure of such a complex with a diprotonated organic amine cation has been reported.

(I)

The asymmetric unit of the title compound, (I), consists of halves of two centrosymmetric $\left[\mathrm{Ti}_{4} \mathrm{O}_{4}\left\{\mathrm{~N}\left(\mathrm{CH}_{2} \mathrm{COO}\right)_{3}\right\}_{4}\right]^{4-}$ anions, two $\left[\mathrm{H}_{3} \mathrm{~N}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{NH}_{3}\right]^{2+}$ cations and a disordered molecule of water of crystallization. The tetrameric unit, $\left[\mathrm{Ti}_{4} \mathrm{O}_{4}\left[\mathrm{~N}\left(\mathrm{CH}_{2} \mathrm{COO}\right)_{3}\right\}_{4}\right]^{4-}$ (Fig. 1) is very similar to that reported for $\mathrm{Cs}_{4}[\mathrm{TiO}(\mathrm{NTA})]_{4} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ (Wieghardt et al., 1980). Each tetrameric anion lies on a center of symmetry. The titanium(IV) centers are six-coordinate, with two cis- $\mu$-oxo

Figure 1

A perspective view of one anion of (I), with displacement ellipsoids drawn at the $50 \%$ probability level. H atoms have been omitted for clarity. [Symmetry code: $(A) 1-x, 1-y, 2-z$ ]

Figure 2
Strong hydrogen bonds between cations and anions.
bridging atoms; the Ti and $\mu-\mathrm{O}$ atoms form a puckered eightmembered ring with dimensions $3.905 \times 4.150 \AA$. The $\mu$-oxo bridges are not symmetrical. A short $\mathrm{Ti}-\mathrm{O}$ bond (average bond distance $\sim 1.75 \AA$ ) and a longer bond ( $\sim 1.89 \AA$ ) alternate. The $\mathrm{Ti}-\mathrm{O}-\mathrm{Ti}$ bond angles are in the range $160-175^{\circ}$. The short $\mathrm{Ti}-\mathrm{O}$ bonds of the bridging O atoms indicate considerable double-bond character ( $\mathrm{Ti}=\mathrm{O}$ ). The nitrilotriacetate ligand is bonded in a conventional fashion to the titanium(IV) center as a tetradentate ligand.

Ethylenediamine plays the role of counter-ion in the structure. One of the amines exhibits a cis configuration, and the other displays a trans configuration. The anions are connected by hydrogen bonds to $\left[\mathrm{H}_{3} \mathrm{~N}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{NH}_{3}\right]^{2+}$, leading to an intricate three-dimensional network, as shown in Fig. 2. The disordered water molecules are also involved in hydrogen bonding with O atoms of the tetramer units (Table 1).

## Experimental

$\mathrm{Ti}\left(\mathrm{SO}_{4}\right)_{2}(0.4 \mathrm{~g}, 1.67 \mathrm{mmol})$, nitrilotriacetic acid $(1.0 \mathrm{~g}, 5.22 \mathrm{mmol})$, $\mathrm{Cu}\left(\mathrm{NO}_{3}\right)_{2} \cdot 3 \mathrm{H}_{2} \mathrm{O}\left(3 \mathrm{ml}, 0.15 \mathrm{~mol} \mathrm{l}{ }^{-1}\right)$ and $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{ml})$ were mixed, and $\mathrm{H}_{2} \mathrm{~N}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{NH}_{2}$ was added carefully to give a pH of 4.5 . After stirring, the reaction mixture was sealed in a 20 ml Teflon-lined stainless steel vessel and heated at 373 K for 2 d under autogeneous pressure. After the reaction was complete, the vessel was cooled slowly to room temperature and colorless crystals were obtained.

## metal-organic papers

All H atoms of the cations and anions were positioned geometrically $\left[\mathrm{C}-\mathrm{H}=0.97 \AA, \mathrm{~N}-\mathrm{H}=0.89 \AA\right.$, and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$ and $\left.1.5 U_{\text {eq }}(\mathrm{N})\right]$ and treated as riding. The H atoms of the molecule of water of crystallization were placed in calculated positions $(\mathrm{O}-\mathrm{H}=$ $0.8440-0.8808 \AA$ ) (Nardelli, 1999) and were not further refined $\left[U_{\text {iso }}(\mathrm{H})=0.05 \AA^{3}\right]$.

Data collection: TEXRAY (Molecular Structure Corporation, 1999); cell refinement: TEXRAY; data reduction: TEXSAN (Molecular Structure Corporation, 1999); program(s) used to solve structure: SHELXS 97 (Sheldrick, 1997); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: ORTEX (McArdle, 1995) and CAMERON (Watkin et al., 1993); software used to prepare material for publication: SHELXL97.

This work was supported by the Natural Science Foundation of Fujian Province (project Nos. E0110013 and K02028) and the State Key Laboratory of Structural Chemistry, Fujian Institute of Research on the Structure of Matter, Chinese

Academy of Sciences. The authors thank Dr Guangcan Xiao of the X-ray Laboratory of Fuzhou University, who helped complete the data collection.
