## Bis(2,4-dibromophenyl) ether

Packing effects are shown to be of minor importance in determining the molecular conformation of the title compound, $\mathrm{C}_{12} \mathrm{H}_{6} \mathrm{Br}_{4} \mathrm{O}$, by comparison with a conformational map calculated with semi-empirical (AM1) calculations.

## Comment

The title compound, (I) (Fig. 1), crystallizes with two molecules in the asymmetric unit, a situation not occurring in the other brominated diphenyl ethers with known crystal structures. All four benzene rings are planar to within 0.01 (1) $\AA$. No anomalous bond distances or angles are found (Table 1). The two rings of molecule 1, C1-C6 and C7-C12, are inclined at $67.5(1)^{\circ}$ to each other, and the two rings of molecule 2 , $\mathrm{C} 13-\mathrm{C} 18$ and $\mathrm{C} 19-\mathrm{C} 24$, are inclined at $62.0(1)^{\circ}$ to each other.

(I)

The orientational relation between the two unique molecules, shown in Fig. 2, was computed using the program ROTERA (Norrestam, 2004; Diamond, 1988). The average deviation between the atoms in the two molecules, one of them rotated to a perfect overlap with the central O and neighbouring C atoms, is $0.22 \AA$. The similarity between the two molecules can also be deduced from the similar torsion angles involving the ether O atom in the two molecules (Table 1). The observed torsion angles defining the relative

Figure 1
The molecular structure of (I), showing the atom-numbering scheme. Displacement ellipsoids are drawn at the $50 \%$ probablity level and H atoms are shown as circles of arbitrary radii.

Figure 2

A stereoview of an overlay of the two unique molecules of (I), one of them rotated to a perfect overlap at the O and its two neighbouring C atoms.
orientation of the aromatic rings can be reproduced by semiempirical calculations using the $A M 1$ Hamiltonian with MOPAC-6 (Stewart, 1990), to an average discrepancy between observed and calculated torsion angles of $10^{\circ}$. Several broad shallow minima can be detected in the complete torsion map, shown in Fig. 3, computed with MOPAC-6 with $10^{\circ}$ spacing for the two torsion angles defining the conformation over the ether O atom. Thus, one may draw the conclusion that packing effects are of minor importance in determining the conformations of the molecules comprising (I).

The two shortest intermolecular $\mathrm{Br} \cdots \mathrm{Br}$ contacts are $\mathrm{Br} 2 \cdots \mathrm{Br} 4^{\mathrm{i}}$ [3.808 (1) $\AA$; symmetry code: (i) $1-x, 1-y$, $1-z]$ and $\mathrm{Br} 2 \cdots \mathrm{Br}^{\mathrm{i}}$ [3.779 (1) Å]. These intermolecular $\mathrm{Br} \cdots \mathrm{Br}$ distances cannot be regarded as short in a comparison with similar intermolecular $\mathrm{Br} \cdots \mathrm{Br}$ contacts for Br -substituted aromatic substances found in a search of the Cambridge Structural Database (CSD, Version 5.25 of November 2003; Allen, 2002; Orpen, 2002; Allen \& Motherwell, 2002; Taylor, 2002). The intermolecular $\mathrm{Br} \cdots \mathrm{Br}$ contacts in (I) shorter than $4.15 \AA$ are mediating contacts between different molecules in the $a$ direction. The cut-off distance of $4.15 \AA$ should be considered long for $\mathrm{Br} \cdots \mathrm{Br}$ interactions when compared with other $\mathrm{Br} \cdots \mathrm{Br}$ contacts found in the CSD. Most of the intermolecular $\mathrm{Br} \cdots \mathrm{Br} \cdots \mathrm{Br}$ angles for the above-mentioned contacts shorter than $4.15 \AA$ are close to $90^{\circ}$, and none is less than $55^{\circ}$.

## Experimental

The synthesis of the title compound has been descibed earlier by Hu (1999). Crystals of (I) were obtained from a solution in ethanol.

## Crystal data

$\mathrm{C}_{12} \mathrm{H}_{6} \mathrm{Br}_{4} \mathrm{O}$
$M_{r}=485.81$
Monoclinic, $P 2_{1} / c$

## organic papers

The $R_{\text {int }}$ value is rather high, due in large part to unobserved and/ or weak reflections. Neglecting all reflections with negative observed intensity (none more significant than $3.5 \sigma$ ) decreases $R_{\text {int }}$ to 0.073 . Furthermore, if all reflections less significant than $3 \sigma$ are omitted, $R_{\text {int }}$ drops to 0.051 . This shows clearly that a large number of weak reflections make large contributions to $R_{\text {int }}$. H atoms were placed in geometrical positions and refined as riding, with $\mathrm{C}-\mathrm{H}$ distances of $0.93 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$.

Data collection: EXPOSE in IPDS (Stoe, 1997); cell refinement: $C E L L$ in IPDS; data reduction: INTEGRATE in IPDS; program(s) used to solve structure: SHELXS97 (Sheldrick, 1990); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: DIAMOND (Bergerhoff, 1996); software used to prepare material for publication: EASYPLOT (Karon, 1999)
