## Bis[ $\mu$-3-methoxysalicylaldehyde (4-methoxybenzoyl)hydrazonato]bis[pyridinecopper(II)] methanol disolvate

The title complex crystallizes as a methanol solvate, $\left[\mathrm{Cu}_{2}\left(\mathrm{C}_{16} \mathrm{H}_{14} \mathrm{O}_{4} \mathrm{~N}_{2}\right)_{2}\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}\right)_{2}\right] \cdot 2 \mathrm{CH}_{4} \mathrm{O}$. The dinuclear complex is generated from the atoms of the asymmetric unit by inversion symmetry, resulting in a $\mathrm{Cu} \cdots \mathrm{Cu}$ separation of 3.497 (3) A. The copper(II) species has a square-pyramidal geometry, with the basal plane defined by two O atoms and one N atom from the hydrazone ligand and a pyridine N atom. The apical site is occupied by a phenolate O atom in the symmetry-generated hydrazone ligand, which also bonds to the second Cu atom. Intramolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds are formed between the methanol solvent molecules and the uncoordinated N atoms of the hydrazone ligand.

## Comment

The study of transition metal-hydrazone complexes, in which the hydrazone ligands are formed by condensing hydrazine with $\beta$-diketones, salicylaldehyde and their derivatives, has attracted considerable attention because of the biological activity and chemical versatility of these complexes (Dutta et al., 1995; Liu \& Gao, 1998; Gao et al., 1998). However, there is relatively little information about the structures of metal complexes containing the 3-methoxysalicylaldehyde (4-methoxybenzoyl)hydrazone ligand $\left(\mathrm{H}_{2} L\right)$, which is a potentially tridentate chelating agent, formed by condensing 3-methoxysalicylaldehyde with 4-methoxybenzoylhydrazine. We have recently reported the structures of one iron and two oxovanadium( V ) complexes of this ligand, in which the ligand possesses different formal charges ( -2 for the vanadium systems and -1 for the iron system; (Huo, Gao, Liu, Zhao \& Ng, 2004; Huo, Gao, Liu, Li, Zhao \& Zhao, 2004; Huo, Gao, $\mathrm{Liu}, \mathrm{Li} \& \mathrm{Ng}, 2004)$. As part of our continuing investigation of the coordination behavior of this hydrazone ligand, we have synthesized the title complex, $\left[\mathrm{Cu}\left(\mathrm{C}_{16} \mathrm{H}_{14} \mathrm{O}_{4} \mathrm{~N}_{2}\right)\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}\right)\right]_{2}--$ $2\left(\mathrm{CH}_{4} \mathrm{O}\right)$, (I), in which the phenolato O atom acts as a $\mu^{2}$ bridging species, thus forming a dinuclear structure.

As shown in Fig. 1, the crystal structure of (I) consists of an asymmetrically bridged dimer, $[\mathrm{Cu}(L) \text { (pyridine) }]_{2}$, accom-

A view of the dimeric structure of (I), with displacement ellipsoids at the $30 \%$ probability level. The $\mathrm{O}-\mathrm{H} \cdots \mathrm{N}$ hydrogen bonds are indicated by dashed lines. Symmetry code as in Table 1.
panied by solvated methanol molecules. The dimer is generated by inversion symmetry from the unique atoms, resulting in a $\mathrm{Cu} \cdots \mathrm{Cu}^{\mathrm{i}}$ (see Table 1 for symmetry code) distance of 3.497 (3) A. Phenolate atom O1 of the hydrazone ligand acts as the bridging species, resulting in one short $[1.910(2) \AA]$ and one very long $[2.725(3) \AA] \mathrm{Cu}-\mathrm{O}$ bond length (Table 1). Each $\mathrm{Cu}^{\text {II }}$ atom exists in a square-pyramidal geometry. The basal plane is defined by atoms $\mathrm{O} 1, \mathrm{O} 2$ and N 1 from the hydrazone ligand and pyridine atom N 3 , with an r.m.s. deviation from the mean plane of $0.066 \AA$. The apical site is occupied by $\mathrm{O} 1^{\mathrm{i}}$ of the symmetry-generated hydrazone ligand. The $\mathrm{Cu}^{\text {II }}$ atom deviates from the basal plane by 0.0649 (8) $\AA$ towards the apical atom $\mathrm{O} 1^{\mathrm{i}}$. Bond lengths (Table 1) indicate electron delocalization in the hydrazone ligand, which results in atom N2 being easily deprotonated. Both the six-membered chelate ring $\mathrm{N} 1 / \mathrm{C} 7 / \mathrm{C} 6 / \mathrm{C} 1 / \mathrm{O} 1 / \mathrm{Cu} 1($ r.m.s. deviation $=0.063 \AA$ ) and the five-membered chelating ring $\mathrm{O} 2 / \mathrm{C} 9 / \mathrm{N} 1 / \mathrm{N} 2 / \mathrm{Cu} 1$ (r.m.s. deviation $=0.021 \AA$ ) are close to planar, and the dihedral angle between them is $5.64(4)^{\circ}$. The methanol molecules form intramolecular hydrogen bonds with the uncoordinated N atoms of the hydrazone ligand (Table 2).

## Experimental

The 3-methoxysalicylaldehyde (4-methoxybenzoyl)hydrazone ligand was synthesized by condensing 3-methoxysalicylaldehyde with equimolar 4-methoxybenzoylhydrazine in ethanol. Copper(II) acetate monohydrate ( 2 mmol ) was added to a methanol solution ( 30 ml ) containing 3-methoxysalicylaldehyde (4-methoxybenzoyl)hydrazone $(2 \mathrm{mmol})$. The resulting mixture was refluxed with stirring for 1.5 h , and then cooled slowly to room temperature and filtered. Blue prismshaped crystals were obtained from the solution after several days. Analysis calculated for $\mathrm{C}_{44} \mathrm{H}_{46} \mathrm{Cu}_{2} \mathrm{~N}_{6} \mathrm{O}_{10}$ : C 55.87, H 4.90, N $8.88 \%$; found: C 55.99, H 4.85, N 8.82\%.
