## A monoclinic modification of $N$-(3,4-dibenzoyl-2,5-dimethylpyrrol-1-yl)-4-methoxybenzamide

The molecule of the title compound, $\mathrm{C}_{28} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{4}$, in the monoclinic modification shows no significant differences in bond dimensions from those in the reported orthorhombic modification [Gao et al. (2004). Acta Cryst. E60, o1733-o1735]. Two molecules are linked across a center of inversion by a pair of amide-carbonyl hydrogen bonds $[2.867$ (2) A $]$.

## Comment

N -(Dibenzoyldimethylpyrrol-1-yl)-4-methoxybenzamide represents a pyrrole that is severely crowded owing to substituents on all atoms of the five-membered ring. A previous study had documented the compound belonging to the orthorhombic crystal system (Gao et al., 2004). The synthesis, albeit in a slightly different solvent, afforded the monoclinic modification, (I) (Fig. 1). It is not clear whether the two modifications were obtained in the same reaction, or whether the solvent itself governed the crystallization. The principal bond dimensions are not significantly different in the two modifications; the monoclinic modification is marginally denser $\left(D_{x}=1.263 \mathrm{Mg} \mathrm{m}^{-3}\right)$ than the orthorhombic modification ( $D_{x}=1.250 \mathrm{Mg} \mathrm{m}^{-3}$ ).

(I)

## Experimental

Glacial acetic acid ( 3 ml ) was added to an ethanol solution ( 3 ml ) of benzoylacetone ( $21.1 \mathrm{~g}, 0.13 \mathrm{~mol}$ ) and 4-methoxybenzoylhydrazine $(16.2 \mathrm{~g}, 0.10 \mathrm{~mol})$ in the condensation for the $\alpha, \beta$-diketone with the hydrazine. The mixture was refluxed for 3 h . The pale yellow title compound was isolated as crystals when the filtered solution was set aside for several days. Analysis calculated for $\mathrm{C}_{28} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{4}$ : C 74.32, H 5.35 , N $6.19 \%$; found: C 74.60 , H 5.30, N $6.11 \%$. In the previously reported synthesis (Gao et al., 2004), methanol was used as solvent.

## Crystal data

```

H atoms bonded to C atoms were placed in calculated positions $\left[\mathrm{C}-\mathrm{H}=0.93 \AA\right.$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})$ for aromatic H atoms, and $\mathrm{C}-\mathrm{H}=0.96 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C})$ for methyl H atoms, which were rotated to fit the electron density] and included in the refinement in the riding-model approximation. The amide H atom was refined isotropically.

ORTEPII (Johnson, 1976) plot of (I), with ellipsoids drawn at the $50 \%$ probability level. H atoms are drawn as spheres of arbitrary radii.

Data collection: RAPID-AUTO (Rigaku, 1998); cell refinement: RAPID-AUTO; data reduction: CrystalStructure (Rigaku/MSC, 2002); program(s) used to solve structure: SHELXS97 (Sheldrick, 1997); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: ORTEPII (Johnson, 1976); software used to prepare material for publication: SHELXL97.

We thank the National Natural Science Foundation of China (No. 20101003), the Scientific Fund for Remarkable Teachers of Heilongjiang Province (No. 1054G036) and the University of Malaya for supporting this study.
