## Key indicators

Single-crystal X-ray study  
T = 150 K  
Mean  $\sigma(\text{C}-\text{C}) = 0.006 \text{ \AA}$   
Disorder in solvent or counterion  
R factor = 0.069  
wR factor = 0.205  
Data-to-parameter ratio = 14.9For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.**[1-(3-Aminopropyl)-4,7-dithia-1-azacyclononane- $\kappa^4\text{N},\text{N}',\text{S},\text{S}'$ ]bis(dimethylformamide- $\kappa\text{O}$ )nickel(II) bis(tetraphenylborate) acetonitrile disolvate**

In the title complex,  $[\text{Ni}(\text{C}_3\text{H}_7\text{NO})_2(\text{C}_9\text{H}_{20}\text{N}_2\text{S}_2)](\text{C}_{24}\text{H}_{20}\text{B})_2 \cdot 2\text{CH}_3\text{CN}$ , the metal centre has a distorted octahedral environment, with four coordination sites occupied by two N- and two S-donor atoms from a 3-aminopropyl pendant arm derivative of the nine-membered macrocycle 1-aza-4,7-dithia-cyclononane, and the remaining two positions by two mutually *cis* dimethylformamide ligands.

## Comment

The coordination chemistry of mixed thia–aza nine-membered macrocycles is of particular interest since the loss of threefold symmetry with respect to 1,4,7-triazacyclononane ( $[\text{9}]_{\text{ane}}\text{N}_3$ ) and the presence of both hard N- and soft S-donors can have interesting stereochemical consequences and thereby offer specific coordination selectivity (Danks *et al.*, 1998). Recently, we have reported on the coordination chemistry of nitrile and amino pendant arm derivatives of 1,4-diaza-7-thiacyclononane ( $[\text{9}]_{\text{ane}}\text{N}_2\text{S}$ ) and 1-aza-4,7-dithiacyclononane ( $[\text{9}]_{\text{ane}}\text{NS}_2$ ) with  $\text{Pd}^{\text{II}}$  and  $\text{Cu}^{\text{II}}$  (Arca *et al.*, 2003). A distorted square-pyramidal coordination is generally observed at these metal centres with 3-aminopropyl pendant arm derivatives of  $[\text{9}]_{\text{ane}}\text{N}_2\text{S}$  and  $[\text{9}]_{\text{ane}}\text{NS}_2$  which show strong basal coordination of the N-donors of the macrocycle and of the primary amine group(s).

We report here the X-ray crystal structure of the title  $\text{Ni}^{\text{II}}$  complex, (I), obtained by reacting the 3-aminopropyl pendant arm derivative of  $[\text{9}]_{\text{ane}}\text{NS}_2$  with  $\text{NiCl}_2$  in  $\text{MeOH}/\text{H}_2\text{O}$  followed by addition of excess sodium tetraphenylborate. Crystals were obtained by diffusion of  $\text{Et}_2\text{O}$  vapour first into a solution of acetonitrile and subsequently into a solution of the resulting solid in dimethylformamide. The metal centre is in a distorted octahedral geometry (Fig. 1) with two positions occupied by mutually *cis* dimethylformamide ligands and the remaining four by the two N- and two S-donor atoms of the pendant-arm macrocyclic ligand. The Ni–O and Ni–NH<sub>2</sub> bond lengths (Table 1) are both slightly shorter than the Ni–N<sub>4</sub> distance which involves the tertiary macrocyclic N-donor.

**Figure 1**  
A view of the title cation, with displacement ellipsoids drawn at the 30% probability level. The two counter-anions and two solvent molecules are not shown, and H atoms have been omitted for clarity.

This leads to a trigonal elongation of the octahedron towards the triangular face formed by three of the macrocyclic donors. The S-donor *trans* to the NH<sub>2</sub> group lies slightly further from the metal than the one *trans* to the dimethylformamide donor O1.

## Experimental

A solution of the ligand (30 mg, 0.136 mmol) and NiCl<sub>2</sub> (17.63 mg, 0.136 mmol) in MeOH/H<sub>2</sub>O (10 ml, 1:1 *v/v*) was refluxed for 1 h. Excess sodium tetraphenylborate was added and a purple solid formed. Purple crystals were obtained as follows: first, Et<sub>2</sub>O vapour was diffused into a solution of this solid in acetonitrile and a solid product isolated; second, this solid was dissolved in dimethylformamide and Et<sub>2</sub>O vapour diffused into the solution (yield 51.7 mg, 33%). Found (calculated for C<sub>67</sub>H<sub>80</sub>B<sub>2</sub>N<sub>6</sub>NiO<sub>2</sub>S<sub>2</sub>): C 70.33 (70.23), H 6.98 (7.04), N 7.15% (7.33%).

The two MeCN solvent molecules were affected by disorder. In one molecule, the components were each half-occupied while the other clearly had major and minor occupancies of 0.694 (19) and 0.306 (19), respectively. Restraints were applied to the C–C, C≡N and 1,3-C···N distances. Restraints for planarity, local *C*<sub>2v</sub> symmetry and similarity were applied to and between the phenyl rings. Methyl H atoms were located from  $\Delta F$  syntheses while all other H atoms were placed geometrically. Methyl H atoms were refined as part of rigid rotating groups, with C–H = 0.98 Å and *U*<sub>iso</sub>(H) = 1.5*U*<sub>eq</sub>(C). Other H atoms were refined using a riding model, with N–H = 0.92 Å, C–H(*sp*<sup>2</sup> and aryl) = 0.95 and C–H(methylene) = 0.99 Å, and with *U*<sub>iso</sub>(H) = 1.2*U*<sub>eq</sub>(N,C). The maximum electron-density peak lies 1.25 Å from atom C18.

Data collection: *Stadi-4* (Stoe & Cie, 1996); cell refinement: *Stadi-4*; data reduction: *X-RED32* (Stoe & Cie, 1996); program(s) used to solve structure: *SHELXS97* (Sheldrick, 1997); program(s) used to refine structure: *SHELXL97* (Sheldrick, 1997); molecular graphics: *PLATON* (Spek, 2003); software used to prepare material for publication: *enCIFer* (Allen *et al.*, 2004) and *PLATON*.

We thank EPSRC for funding the purchase of the diffractometer.
