## Tetrakis( $\mu$ - $N$-acetyl- $N$-phenylglycinato- $\kappa^{2} O, O^{\prime}$ )bis[( $N$-acetyl- $N$-phenylglycinato- $\kappa^{3} O, O, O$ )-(1,10-phenanthroline- $\kappa^{2} N, N^{\prime}$ )cerium(III)] dihydrate

In the title complex, $\left[\mathrm{Ce}_{2}\left(\mathrm{C}_{10} \mathrm{H}_{10} \mathrm{NO}_{3}\right)_{6}\left(\mathrm{C}_{12} \mathrm{H}_{8} \mathrm{~N}_{2}\right)_{2}\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}$, each Ce atom shows a distorted tricapped trigonal prismatic coordination, comprising two N -atom donors from a $1,10-$ phenanthroline ligand and seven O atoms of the N -acetyl- N phenylglycine ( $L 2$ ) molecules. Two Ce atoms are bridged by two terdentate and two bidentate carboxylate groups of $L 2$, to give a centrosymmetric dimer. The crystal structure is stabilized by intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds.

## Comment

The title complex, (I) (Fig. 1), contains centrosymmetric dinuclear cerium/phenanthroline $/ N$-acetyl- $N$-phenylglycinate complexes and uncoordinated water molecules. Each cerium(III) ion is nine-coordinated by one 1,10 -phenanthroline (L1) ligand via atoms N4 and N5, one chelating bidentate carboxylate group of an $N$-acetyl- $N$-phenylglycine ( $L 2$ ) ligand via O 4 and O 5 , two bridging bidentate carboxylate groups from two $L 2$ ligands via $\mathrm{O}^{i}$ (see Table 1 for symmetry code) and O7, and one bridging terdentate carboxylate group of $L 2$ via $\mathrm{O1}^{\mathrm{i}}$ and chelating terdentate carboxylate groups of $L 2$ via O 1 and O 2 .

(I)

The coordination geometry around Ce is that of a distorted tricapped trigonal prism, with the capping positions occupied by atoms N5 of $L 1$ and O1 and O4 of two L2 ligands. The two Ce ions are connected by four $L 2$ ligands via two bidentate and two terdentate carboxylate bridges, with a $\mathrm{Ce} \cdots \mathrm{Ce}$ distance of 3.9972 (19) A. The average length of the bridging bidentate $\mathrm{Ce}-\mathrm{O}$ bonds ( $2.448 \AA$ ) is slightly less than that of the bridging terdentate $\mathrm{Ce}-\mathrm{O} 1^{\mathrm{i}}$ bond [2.461 (4) $\AA$ ] which, in turn, is less than the average for the chelating bidentate $\mathrm{Ce}-$ O bonds $[2.533(5) \AA$ ) The chelating terdentate $\mathrm{Ce}-\mathrm{O}$ bond is the longest of all. All of these are shorter than the $\mathrm{Ce}-\mathrm{N}$ bonds. The other bond lengths and angles in (I) are unexceptional.

Received 29 November 2004 Accepted 21 December 2004 Online 8 January 2005

Figure 1
The structure of the title compound, (I), showing $50 \%$ probability displacement ellipsoids and the atom-numbering scheme. H atoms have been omitted.

The crystal packing of (I), showing the hydrogen-bonding interactions as dashed lines. H atoms have been omitted.

The $\mathrm{Ce}-\mathrm{O}$ bonds in (I) are shorter than the equivalent $\mathrm{La}-\mathrm{O}$ bonds in the corresponding lanthanum compound $(\mathrm{Fu}$ et al., 2004), where the average $\mathrm{La}-\mathrm{O}$ bonds for bridging bidentate, bridging terdentate, chelating bidentate, chelating terdentate ligands and the average $\mathrm{La}-\mathrm{N}$ bond distances are $2.452,2.467,2.543,2.625$ and $2.666 \AA$, respectively. The water O atom in (I) does not coordinate to Ce , but participates in intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 2), which stabilize the crystal packing (Fig. 2).

## Experimental

$\mathrm{Ce}\left(\mathrm{NO}_{3}\right)_{3} \cdot n \mathrm{H}_{2} \mathrm{O}(1 \mathrm{mmol})$ and $L 1(1 \mathrm{mmol})$ were dissolved in anhydrous ethanol ( 20 ml ). To this solution, an aqueous solution ( 30 ml ) of $L 2(2 \mathrm{mmol})$ and $\mathrm{NaOH}(2 \mathrm{mmol})$ was added dropwise at 313 K . The mixture was stirred for 3 h and about half of the solvent was evaporated in a rotary vacuum evaporator at the same temperature. The resulting solution was filtered and left to stand in air for about 30 d. Large yellow block-like crystals were obtained. Elemental analysis found: $\mathrm{C} 55.08, \mathrm{H} 4.33, \mathrm{~N} 7.56 \%$; calculated for $\mathrm{C}_{84} \mathrm{H}_{80} \mathrm{Ce}_{2} \mathrm{~N}_{10} \mathrm{O}_{20}$ : C 55.14, H 4.41, N $7.65 \%$.

Symmetry codes: (ii) $1+x, y, z$; (iii) $1+x, y, z-1$.
The water $\mathrm{O}-\mathrm{H}$ distances were restrained to 0.85 (3) $\AA$ and the $\mathrm{H} \cdots \mathrm{H}$ distance to 1.38 (3) $\AA$; their $U_{\text {iso }}(\mathrm{H})$ values were allowed to refine. All other H atoms were placed in idealized positions and constrained to ride on their parent atoms, with $\mathrm{C}-\mathrm{H}$ distances of $0.93-0.97 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C})$. The highest peak in the final difference map is $1.5 \AA$ from C36 and the deepest hole is $1.0 \AA$ from the Ce atom.
