## Key indicators

Single-crystal X-ray study
$T=163 \mathrm{~K}$
Mean $\sigma(\mathrm{C}-\mathrm{C})=0.005 \AA$
$R$ factor $=0.020$
$w R$ factor $=0.043$
Data-to-parameter ratio $=13.8$
For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

The X-ray crystal structure of the title compound, 1-methylcytosinium iodide 1-methylcytosine, [(1-MeC) $\left.)_{2} \mathrm{H}\right] \mathrm{I}(1-\mathrm{MeC}$ is 1-methylcytosine) or $\mathrm{C}_{5} \mathrm{H}_{8} \mathrm{~N}_{3} \mathrm{O}^{+} \cdot \mathrm{I}^{-} \cdot \mathrm{C}_{5} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}$, has been determined at 163 K . In this compound, one protonated $\left(1-\mathrm{MeCH}^{+}\right)$and one neutral methylcytosine (1-MeC) moiety form an asymmetric base pair comprising three hydrogen bonds. A previous structure determination [Krüger, Bruhn \& Steinborn (2004). Org. Biomol. Chem. 2, 2513-2516] showed the same cell parameters but a centrosymmetric base pair in space group $P 2_{1} / c$. At low temperature, however, we discovered the title compound to be a racemic twin showing pseudo-centrosymmetry.

## Comment

Hydrogen bonds are a common structural feature in nucleic acids (Lavery \& Zakrzewska, 1999). Although typically two different nucleobases undergo base pairing (e.g. guanine:cytosine, adenine:thymine), several hydrogen-bonding patterns are known with base pairing between identical nucleobases. The i-motif, consisting of two parallel-stranded intertwined double helices made up entirely of cytosine, is a well known example (Patel et al., 1999). A recent publication describes the crystal structure of a centrosymmetric hemiprotonated methylcytosine:methylcytosine base pair, $\left[(1-\mathrm{MeC})_{2} \mathrm{H}\right] \mathrm{I}$ (Krüger et al., 2004). Concomitant DFT calculations suggest the formation of an asymmetric base pair, however. We report here the crystal structure of this compound in a different crystal configuration, determined at 163 K , displaying the theoretically predicted asymmetric base pairing pattern (Fig. 1). The crystal was obtained in the course of our studies of model systems for metal-mediated base pairs (Müller et al., 2005).

Figure 1
View of the cation of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at the $50 \%$ probability level.

The hydrogen-bonded nucleobases of the title compound are almost coplanar $\left[1.6(2)^{\circ}\right]$. Two base pairs are bridged via the iodide counter-ion (Fig. 2), which forms hydrogen bonds to the exocyclic amine groups of both bases [3.633 (2) and 3.717 (3) A]. Two crystallographically independent $1-\mathrm{MeC}$ moieties of neighbouring base pairs stack at a distance of approximately $3.4 \AA$, leading to the formation of a chain structure with two individual chains I and II (Fig. 3).

The H atom at the N 3 position of $1-\mathrm{MeCH}^{+}$was located in difference Fourier maps. The protonation site is further corroborated by an increase in the $\mathrm{C} 2-\mathrm{N} 3-\mathrm{C} 4$ angle [125.1 (3) ${ }^{\circ}$ in $1-\mathrm{MeCH}^{+}$and 119.6 (2) ${ }^{\circ}$ in $1-\mathrm{MeC}$ ]. In addition, the two $\mathrm{N} 4(\mathrm{H}) \cdots \mathrm{O}$ hydrogen bonds display different bond lengths, resulting in a 2.762 (4) $\AA$ distance for the stronger bond involving $\mathrm{N} 4(\mathrm{H})$ of $1-\mathrm{MeCH}^{+}$and 2.901 (3) $\AA$ for the weaker bond (see Table 2 for hydrogen-bond geometries). Accordingly, both the $\mathrm{C} 4-\mathrm{N} 4$ and the $\mathrm{C} 2-\mathrm{O} 2$ bonds are significantly shorter in $1-\mathrm{MeCH}^{+}$than in $1-\mathrm{MeC}[1.291$ (5) versus 1.333 (4) $\AA$ and 1.219 (3) versus $1.245(3) \AA]$. The $\mathrm{N} 3 \cdots \mathrm{~N} 3^{\prime}$ distance is 2.808 (4) $\AA$. All these experimental values correlate well with those of the DFT study (Krüger et al., 2004).

A comparison of the two different crystal forms of $\left[(1-\mathrm{MeC})_{2} \mathrm{H}\right] \mathrm{I}$ with related structures of hemiprotonated cytosine dimers containing a variety of other counter-ions or solvent molecules reveals that in almost all cases asymmetric base pairs are observed (Salam \& Aoki, 2000; Schimanski et al., 1998; Kistenmacher et al., 1980; Fujinami et al., 1979; Kistenmacher et al., 1979). Only one of the crystallographically independent $1-\mathrm{MeCH}^{+}: 1-\mathrm{MeC}$ pairs in the structure of cytosine hemitrichloroacetate has been proposed as truly symmetric (Gdaniec et al., 1988), whereas in the other centrosymmetric structures known to date this symmetry appears to be a consequence of a disordered H atom in the central hydrogen bond (Krüger et al., 2004; Gdaniec et al., 1988). The difference between the crystal structure presented in this work and its symmetric counterpart (Krüger et al., 2004) is presumably based on a temperature-dependent change from disorder to order, supporting this assumption.

Two base pairs bridged via an iodide counter-ion. Displacement ellipsoids are drawn at the $50 \%$ probability level. The unlabelled asymmetric pair is related by the symmetry operator $(x+1, y, z+1)$. Dashed lines indicate hydrogen bonds.

## Experimental

The title compound was synthesized according to published protocols (Kistenmacher et al., 1979).

Symmetry codes: (i) $x-1, y, z-1$; (ii) $-x+1, y+\frac{1}{2},-z+1$; (iii) $-x, y-\frac{1}{2},-z$.
H atoms, except $\mathrm{H}^{\prime}$, were included in calculated positions with distances ranging from 0.86 to $0.96 \AA$ and included in the refinement in the riding-model approximation with refined isotropic displacement parameters. Atom H3' was found in the difference Fourier map and refined without restraints.

Data collection: KappaCCD Software (Nonius, 1998); cell refinement: DENZO and SCALEPACK (Otwinowski \& Minor, 1997); data reduction: DENZO and SCALEPACK; program(s) used to solve structure: $\operatorname{SHELXS86}$ (Sheldrick, 1990a); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: SHELXTL-Plus (Sheldrick, 1990b); software used to prepare material for publication: SHELXL97.

This work was supported by the Deutsche Forschungsgemeinschaft (Emmy Noether-Programme), the Department of Chemistry at the University of Dortmund and the Fonds der Chemischen Industrie. The authors thank Professor Dr Bernhard Lippert for his continuous support.
