# 1,10-Phenanthrolin-1-ium 2-carboxy-4-nitrobenzoate 

The cation of the title salt, $\mathrm{C}_{12} \mathrm{H}_{9} \mathrm{~N}_{2}^{+} \cdot \mathrm{C}_{8} \mathrm{H}_{4} \mathrm{NO}_{6}^{-}$, is a monoprotonated 1,10-phenanthroline molecule, whereas its anion is a monodeprotonated 4-nitrophthalic acid molecule. There is a strong, almost symmetrical, intramolecular hydrogen bond linking the O atoms of neighbouring carboxylate groups within the anion $[\mathrm{O}-\mathrm{H}=1.13(4) \AA, \mathrm{H} \cdots \mathrm{O}=$ 1.27 (4) $\AA, \mathrm{O} \cdots \mathrm{O}=2.395(3) \AA$ and $\left.\mathrm{O}-\mathrm{H} \cdots \mathrm{O}=173(4)^{\circ}\right]$. An $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ bond $[\mathrm{N}-\mathrm{H}=1.00$ (3) $\AA, \mathrm{H} \cdots \mathrm{O}=1.70$ (3) $\AA$, $\mathrm{N} \cdots \mathrm{O}=2.668(3) \AA$ and $\left.\mathrm{N}-\mathrm{H} \cdots \mathrm{O}=160(3)^{\circ}\right]$ is responsible for formation of ion pairs, which are further loosely aggregated into a three-dimensional framework via $\mathrm{C}-$ $\mathrm{H} \cdots \mathrm{O}$ and $\pi-\pi$ interactions.

## Comment

The title salt, (I), is composed of a cation which is a monoprotonated 1,10-phenanthroline molecule, and an anion, which is a monodeprotonated 4-nitrophthalic acid molecule. The structures of the cation and anion are shown in Fig. 1.

(I)

The protonation of atom N 1 of the cation leads to a significant increase of the $\mathrm{C} 1-\mathrm{N} 1-\mathrm{C} 12$ angle [122.0 (2) ${ }^{\circ}$ ], as compared with the $\mathrm{C} 11-\mathrm{N} 2-\mathrm{C} 10$ angle [116.4 (2) ${ }^{\circ}$ ] at the non-protonated atom N 2 . The increase in the bond angle at the protonated N atom is not unexpected, as an analogous difference in the $\mathrm{C}-\mathrm{N}-\mathrm{C}$ bond angles was observed in previously reported monoprotonated phenanthrolines (e.g. Hensen et al., 1998, 2000).

The anion features an almost symmetrical intramolecular $\mathrm{O} 2-\mathrm{H} 2 A \cdots \mathrm{O} 3$ hydrogen bond (Table 2), linking the O atoms of the neighbouring carboxylate groups. Even though the difference between the $\mathrm{O} 2-\mathrm{H} 2 A$ and $\mathrm{H} 2 A \cdots \mathrm{O} 3$ distances barely exceeds $3 \sigma$, it is correlated with there being a more pronounced difference between the $\mathrm{O}-\mathrm{C}$ bond lengths in one of the carboxyl groups $[\mathrm{O} 1-\mathrm{C} 19=1.208$ (3) $\AA$ and $\mathrm{O} 2-\mathrm{C} 19=$ 1.292 (3) $\AA$ A $]$ than there is in the other group $[\mathrm{O} 4-\mathrm{C} 20=$ 1.226 (3) $\AA$ and $\mathrm{O} 3-\mathrm{C} 20=1.260$ (3) $\AA$. .

Figure 1
A view of the cation and anion in the structure of (I), showing the atomnumbering scheme; displacement ellipsoids are drawn at the $30 \%$ probability level.

Figure 2
A packing diagram of (I), viewed along the $a$ axis, showing hydrogen bonds and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions (dashed lines).

Atom $\mathrm{H} 1 A$ is involved in an $\mathrm{N} 1-\mathrm{H} 1 A \cdots \mathrm{O} 4^{\mathrm{iv}}$ bond [Table 2; symmetry code: (iv) $1+x,-1+y, z$ ], which joins the cations and anions into ion pairs. These are further loosely aggregated into a three-dimensional framework via relatively weak $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interactions (Table 2), as well as $\pi-\pi$ interactions between the $\mathrm{N} 2 / \mathrm{C} 10 / \mathrm{C} 9 / \mathrm{C} 8 / \mathrm{C} 7 / \mathrm{C} 11$ and $\mathrm{C} 13^{\mathrm{v}}-\mathrm{C} 18^{\mathrm{v}}$ rings [symmetry code: (v) $x, y-1, z$ ]. The interplanar spacing is ca $3.43 \AA$, the ring-centroid separation is 3.730 (2) $\AA$ and the dihedral angle is $1.95(4)^{\circ}$. A packing diagram for the structure of (I) is shown in Fig. 2.

## Experimental

The title salt was prepared by mixing ethanol solutions of 4-nitrophthalic acid ( 0.4 g in 10 ml ) and 1, 10 -phenanthroline ( 0.4 g in 10 ml ). The solution was stirred at room temperature for 10 min , after which the crystalline product was separated by filtration $(0.7 \mathrm{~g}$, yield $87.5 \%$ ). The pure product ( 0.5 g ) was heated and dissolved in water $(25 \mathrm{ml})$. Single crystals were obtained from this aqueous solution by slow concentration over a period of five days at room temperature.

## organic papers

H atoms bonded to the O and N atoms were located in a difference Fourier map and refined in the isotropic approximation. H atoms bonded to C atoms were included in the refinement in the ridingmodel approximation, with $\mathrm{C}-\mathrm{H}=0.93 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{C})$.
